

Advanced Mail

Introduction

- ❑ SPAM vs. non-SPAM
 - Mail sent by spammer vs. non-spammer
- ❑ Problem of SPAM mail
 - Over 99% of E-mails are SPAM! Useless for mankind!
- ❑ SPAM detection?
 - Client-based detection
 - These methods actually are the **spammer detection** techniques.
 - Usually are cost-effective, which can easily reach over 95% accuracy with only few computational resources.
 - Content-based detection
 - These methods are the real **spam detection** techniques.
 - Usually are costly with less than 90% accuracy
 - Lots of training and computation spent on it.
 - Who is the winner? Client-based? Content-based? (or Spammer?)
 - Endless war between the administrators and spammers.

Overview

- ❑ The following techniques are some (new) tools for an administrator to fight with spammers:
 - Greylisting
 - A client-based method that can stop mails coming from some spamming programs.
 - SPF (Sender Policy Framework)
 - A client-based method to detect whether a client is authorized or not.
 - DKIM (DomainKey Identified Mail)
 - A content-based method to verify the source of a mail (with only few computation cost.)

Greylisting (1/2)

- ❑ <http://www.greylisting.org/>
- ❑ Greylisting is a client-based method that can stop mails coming from some spamming programs.
- ❑ Behavior of different clients while receiving SMTP response codes

Response Codes	2xx	4xx	5xx
Normal MTA	Success	Retry later	Give-up
Most Spamming Programs	Success	Ignore and send another	Give-up

- While spammers prefer to send mails to other recipients rather than keeping log and retrying later, MTAs have the responsibility of retring a deferred mail.

Greylisting (2/2)

❑ Idea of greylisting:

- Taking use of 4xx SMTP response code to stop steps of spamming programs.

❑ Steps:

- Pair (recipient, client-ip)
- Reply a 4xx code for the first coming of every (recipient, client-ip) pair.
- Allow retrial of this mail after a period of time (usually 5~20 mins).
 - Suitable waiting time will make the spamming programs giving up this mail.

❑ Tool: mail/postgrey

- A policy service of postfix.
- `/usr/local/etc/postfix/postgrey_whitelist_clients`
- `/usr/local/etc/postfix/postgrey_whitelist_recipients`

Sender Policy Framework (SPF)

- ❑ A client-based method to detect whether a client is authorized or not.
- ❑ <http://www.openspf.org>
- ❑ RFC 4408
- ❑ `cd /usr/ports/mail && make search key=spf`

Sender Policy Framework (SPF)

– Is following mail questionable?

Sender Policy Framework (SPF)

– The idea

- ❑ For a domain administrator, he can claim which mail server will be used in his environment.
 - Ex. For cs.nctu.edu.tw, {csmailer,csmailgate,csmail}.cs.nctu.edu.tw are the authorized mail servers.
 - Mails out from these servers are authorized mails (under control of administrator.)
 - Other mails might be forged and have higher probability to be SPAMs.
- ❑ SPF technique specifies all possible outgoing mail clients in the TXT record of DNS service to claim the authorized mail servers.
- ❑ When destination MTA receives a mail, it will check the client ip:
 - For a mail out from authorized servers, it should be safe.
 - For a mail out from unauthorized servers, it might be forged.

SPF Record Syntax

– Mechanisms (1/2)

- ❑ all
 - Always matches
 - Usually at the end of the SPF record
- ❑ ip4 (**NOT ipv4**)
 - ip4: <ip4-address>
 - ip4: <ip4-network>/<prefix-length>
- ❑ ip6 (**NOT ipv6**)
 - ip6:<ip6-address>
 - ip6:<ip6-network>/<prefix-length>
- ❑ a
 - a
 - a/<prefix-length>
 - a:<domain>
 - a:<domain>/<prefix-length>

SPF Record Syntax

– Mechanisms (2/2)

- ❑ mx
 - mx
 - mx/<prefix-length>
 - mx:<domain>
 - mx:<domain>/<prefix-length>
- ❑ ptr
 - ptr
 - ptr:<domain>
- ❑ exists
 - exists:<domain>
- ❑ include
 - include:<domain>
 - Warning: If the domain does not have a valid SPF record, the result is a **permanent error**. Some mail receivers will *reject* based on a **PermError**.

SPF Record Syntax

– Qualifiers & Evaluation

❑ Qualifiers

- + Pass (default qualifier)
- - Fail
- ~ SoftFail
- ? Neutral

❑ Evaluation

- Mechanisms are evaluated in order: (first match rule)
 - If a mechanism results in a hit, its qualifier value is used.
 - If no mechanism or modifier matches, the default result is "Neutral"
- Ex.
 - "v=spf1 +a +mx -all"
 - "v=spf1 a mx -all"

SPF Record Syntax

– Evaluation Results

Result	Explanation	Intended action
Pass	The SPF record designates the host to be allowed to send	Accept
Fail	The SPF record has designated the host as NOT being allowed to send	Reject
SoftFail	The SPF record has designated the host as NOT being allowed to send but is in transition	Accept but mark
Neutral	The SPF record specifies explicitly that nothing can be said about validity	Accept
None	The domain does not have an SPF record or the SPF record does not evaluate to a result	Accept
PermError	A permanent error has occurred (eg. Badly formatted SPF record)	Unspecified
TempError	A transient error has occurred	Accept or reject

SPF Record Syntax

– Modifier

❑ redirect

- redirect=<doamin>
- The SPF record for domain replace the current record. The macro-expanded domain is also substituted for the current-domain in those look-ups.

❑ exp

- exp=<doamin>
- If an SMTP receiver rejects a message, it can include an explanation. An SPF publisher can specify the explanation string that senders see. This way, an ISP can direct nonconforming users to a web page that provides further instructions about how to configure SASL.
- The domain is expanded; a TXT lookup is performed. The result of the TXT query is then macro-expanded and shown to the sender. Other macros can be used to provide an customized explanation.

Sender Policy Framework (SPF)

– Example of mail from authorized server

- ❑ On `bsd2.cs.nctu.edu.tw`
- ❑ From: `lwhsu@cs.nctu.edu.tw`
- ❑ To: `lwhsu.tw@gmail.com`

- ❑ Related SPF Record:

```
cs.nctu.edu.tw
```

```
"v=spf1 a mx  
a:csmailer.cs.nctu.edu.tw  
a:csmailgate.cs.nctu.edu.tw  
a:csmail.cs.nctu.edu.tw ~all"
```

This is a SPF test.

Sender Policy Framework (SPF)

– SPF and Forwarding

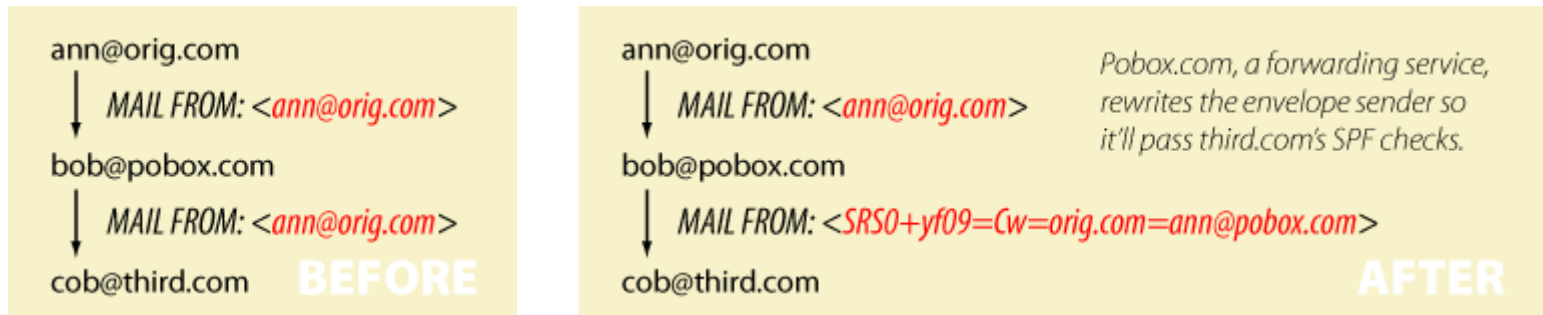

❑ Does SPF break forwarding?

- Yes, but only if the receiver checks SPF without understanding their mail receiving architecture.
- Forwarders should apply Sender Rewriting Scheme (SRS) to rewrite the sender address after SPF checks.
 - If receivers are going to check SPF, they should whitelist forwarders that do not rewrite the sender address from SPF checks.

[Ref] <http://www.openspf.org/FAQ/Forwarding>

❑ SRS: Sender Rewriting Scheme

- <http://www.openspf.org/SRS>

Sender Policy Framework (SPF)

– Forwarding Example

- ❑ On gmail (lwhsu.tw's account)
 - Envelop From: lwhsu.tw@gmail.com
- ❑ Mail Headers
 - From: lwhsu@cs.nctu.edu.tw
 - To: lwhsu@lwhsu.org
- ❑ On knight.lwhsu.org (lwhsu.org's mx)

```

When a mail server sends a bounce message (returned mail), it uses a null MAIL FROM: <>, and a HELO address that's supposed to be its own name. SPF will still operate, but in "degraded mode" by using the HELO domain name instead. Because this wizard can't tell which name your mail server uses in its HELO command, it lists all possible names, so there may be multiple lines shown below. If you know which hostname your mail server uses in its HELO command, you should pick out the appropriate entries and ignore the rest.

Sender Policy Framework (SPF)

– Backward Compatibility (1/2)

DomainKeys and DKIM

❑ A content-based method to verify the source of a mail (with only few computation cost.)

- Allows an organization to claim **responsibility** for transmitting a message, in a way that can be validated by a recipient.

❑ Consortium spec

- Derived from Yahoo DomainKeys and Cisco Identified Internet Mail
- RFCs
 - RFC 4870 Domain-Based Email Authentication Using Public Keys Advertised in the DNS (DomainKeys)
 - **RFC 4871 DomainKeys Identified Mail (DKIM) Signatures**

❑ <http://www.dkim.org/>

- <http://www.dkim.org/info/DKIM-teaser.ppt>

DKIM: Goals

- ❑ Validate message content, itself
 - Not related to path
- ❑ Transparent to end users
 - No client User Agent upgrades *required*
 - But extensible to per-user signing
- ❑ Allow sender delegation
 - Outsourcing
- ❑ Low development, deployment, use costs
 - Avoid large PKI, new Internet services
 - No trusted third parties (except DNS)

DKIM: Idea

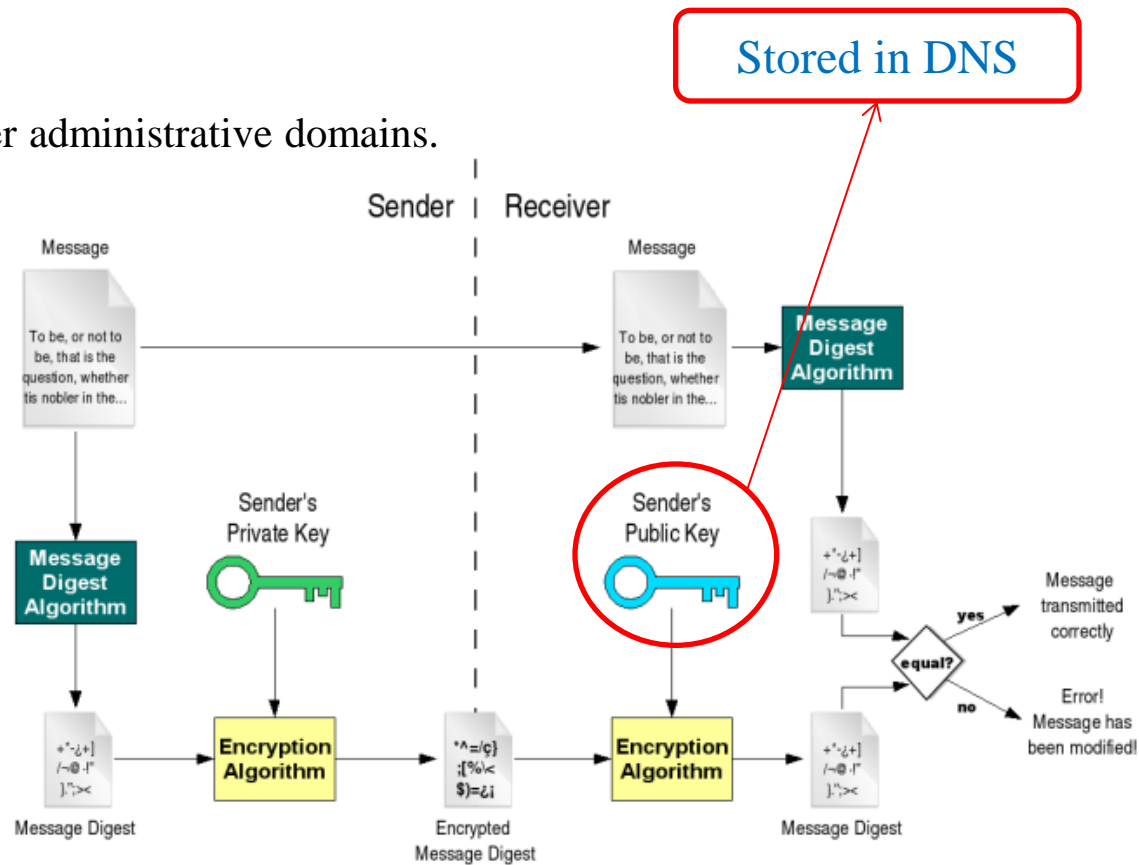

☐ Msg header authentication

- DNS identifiers
- Public keys in DNS

☐ End-to-end

- Between origin/receiver administrative domains.
- Not path-based

✧ Digital signatures

DKIM: Technical High-points

- ❑ Signs body and selected parts of header
- ❑ Signature transmitted in DKIM-Signature header
- ❑ Public key stored in DNS
 - In `_domainkey` subdomain
 - New RR type, fall back to TXT
- ❑ Namespace divided using selectors
 - Allows multiple keys for aging, delegation, etc.
- ❑ Sender Signing Policy lookup for unsigned or improperly signed mail

DKIM-Signature header (1/5)

- ❑ v= Version
- ❑ a= Hash/signing algorithm
- ❑ q= Algorithm for getting public key
- ❑ d= Signing domain
- ❑ i= Signing identity
- ❑ s= Selector
- ❑ c= Canonicalization algorithm
- ❑ t= Signing time (seconds since 1/1/1970)
- ❑ x= Expiration time
- ❑ h= List of headers included in signature;
dkim-signature is implied
- ❑ b= The signature itself
- ❑ bh= Body hash

DKIM-Signature header (2/5)

❑ Example:

**DKIM-Signature: a=rsa-sha1; q=dns;
d=example.com;
i=user@eng.example.com;
s=jun2005.eng; c=relaxed/simple;
t=1117574938; x=1118006938;
h=from:to:subject:date;
b=dzdVyOfAKCdLXdJOc9G2q8LoXSIEniSb
av+yuU4zGeeruD00lszZVoG4ZHRNiYzR**

❑ DNS query will be made to:

jun2005.eng._domainkey.example.com

DKIM-Signature header (3/5)

❑ Example: Signature of Yahoo Mail

```
DKIM-Signature: v=1; a=rsa-sha256; c=relaxed/relaxed;  
d=yahoo.com.tw; s=s1024; t=1242033944;  
bh=t3GnH+pN34KpMhIX59Eezm+9eCI68fU2hgid1Kscdrk=;  
h=Message-ID:X-YMail-OSG:Received:X-Mailer:Date:From:Subject:  
To:MIME-Version:Content-Type: Content-Transfer-Encoding;  
b=emLg4QonGbqb3PhZIEoYfiQVDYMwcBBB6SAEW+RziBEhjxKS2O  
UWmq5EpD1cxX+uz9MzJ4+fK4QRJZOtd0Y10c6Ce2J+V+C/RHnrjZ  
3PF8kAhjqvT1GTTdohxivLGrMftg1xFGO//M7ML/fcI4UJL+XP1xhJMB  
aHIHMGhE1sdGQ=
```

```
DomainKey-Signature: a=rsa-sha1; q=dns; c=noaws; s=s1024;  
d=yahoo.com.tw; h=Message-ID:X-YMail-OSG:Received:X-Mailer:  
Date:From:Subject:To:MIME-Version:Content-Type:Content-  
Transfer-Encoding;  
b=DIAhpuGID5ozcL77Ozm5doCQsxHSWaYHULW2hWAb3heXwewHga  
mqO+McEcSIplcB1JXTIBka7BR6HvbSPWX/XiMrVAjvb6zeRWiXSBWdt  
xIMpQhjJiBdzC8Y1BPCsdv2UwMgxOmR6i51BTII+GDWFIKSgm5ky/  
zU+ZsdwIhlss=;
```

DKIM-Signature header (4/5)

❑ Example: Signature of Google Mail

```
DKIM-Signature: v=1; a=rsa-sha256; c=relaxed/relaxed; d=gmail.com;
s=gamma; h=domainkey-signature:mime-version:date:message-id:
subject:from:to:content-type;
bh=o8h0LUwAIau52hau5ntEJaPU6qQn7rkIboJwbgnuNgc=;
b=DxuMYeFtjXIt5eltj2MlzIXuOLA1y6f94+imgSKexX7EvhGMGUE82+4v
78Vrpm5xmKNKp2xHsjvESpyWEAyt22ZKEV4OHClyqWPuabpwas0UD
tV9KEwf9K663sCvrtoi9IpUQDPjP+aqC+po7tuLRiWfHYMETt5NpQfoWD
pmoXw=
```

```
DomainKey-Signature: a=rsa-sha1; c=noFWS; d=gmail.com; s=gamma;
h=mime-version:date:message-id:subject:from:to:content-type;
b=T2N/3v39iaiL3tWBKoZadVYr5BsotqTIKe7QL3oEy1e+2OiUCIbLGepx
I7YXJ0Wt3MLx3ZcnkdNIGhrCWqXw7aV4gWw7GCsey2qZnakBTQ/BiH3
TyrD3vdaDB8KJU0jC3Q4uE+Y2jQalXC60wsJtCByCpdXq0VVorgpLCJg4
TnM=
```

DKIM-Signature header (5/5)
