Network Introduction

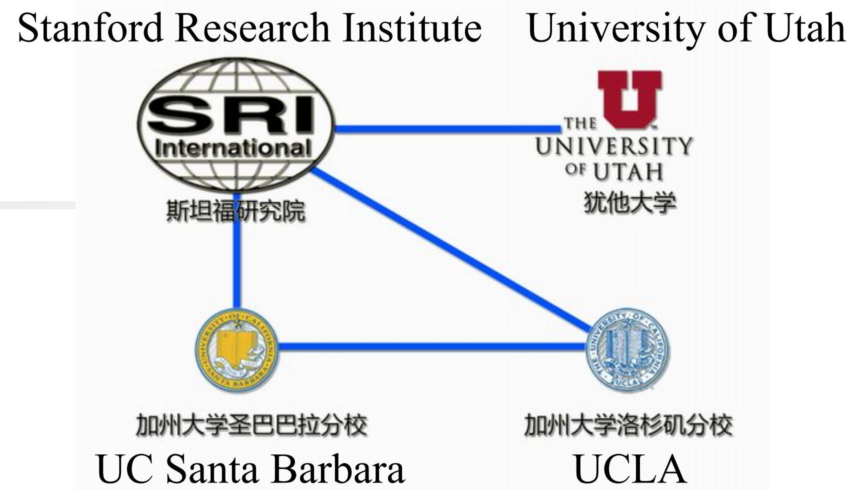
jnlin

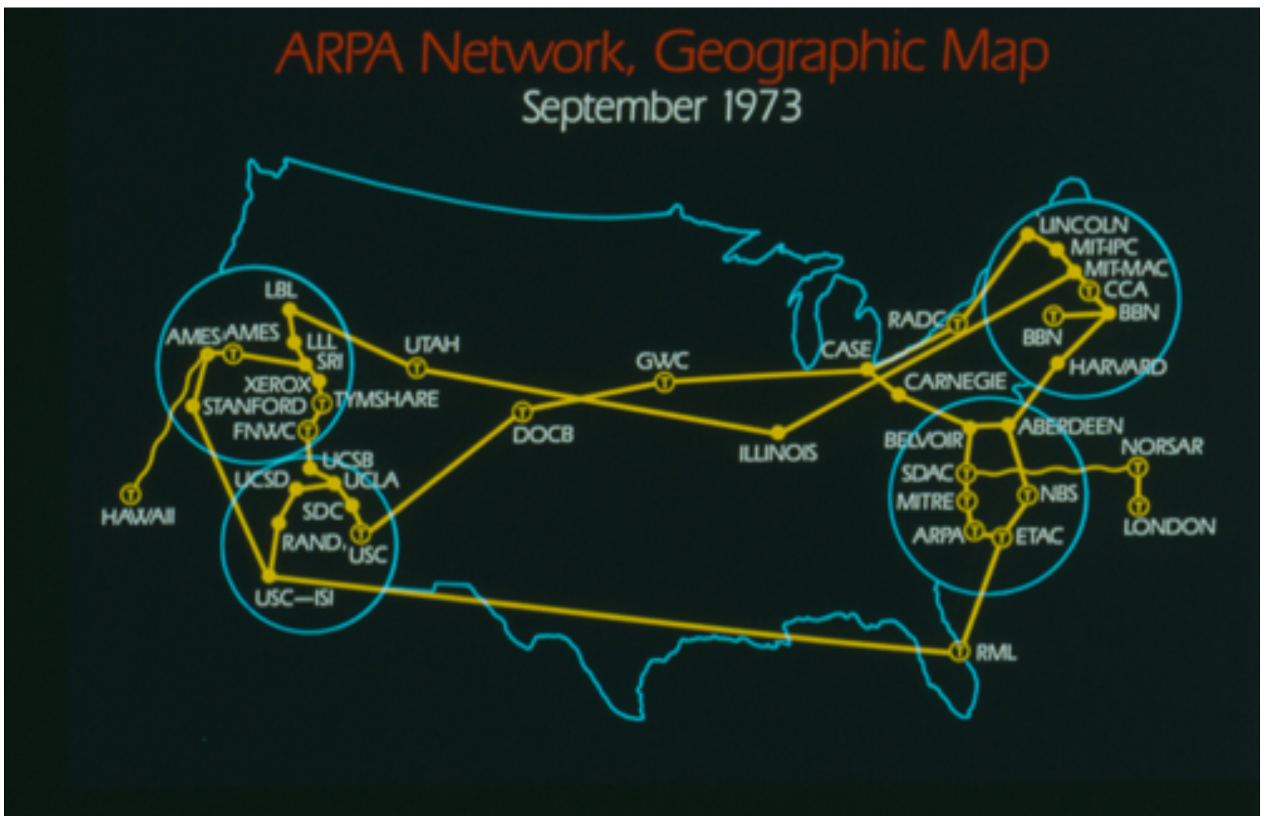
TCP/IP and the Internet

- In 1969
  - ARPA funded and created the "ARPANET" network
    - 高等研究計劃署 (Advanced Research Project Agency)
    - NCP – Network Control Protocol
      - Allow an exchange of information between separated computers
- In 1973
  - How to connect ARPANET with SATNET and ALOHANET
  - TCP/IP begun to be developed
- In 1983
  - TCP/IP protocols replaced NCP as the ARPANET's principal protocol
  - ARPANET → MILNET + ARPANET = Internet
- In 1985
  - The NSF created the NSFNET to connect to Internet
- In 1990
  - ARPANET passed out of existence, and in 1995, the NSFNET became the primary Internet backbone network

ARPA: Advanced Research Project Agency
NSF: National Science Foundation

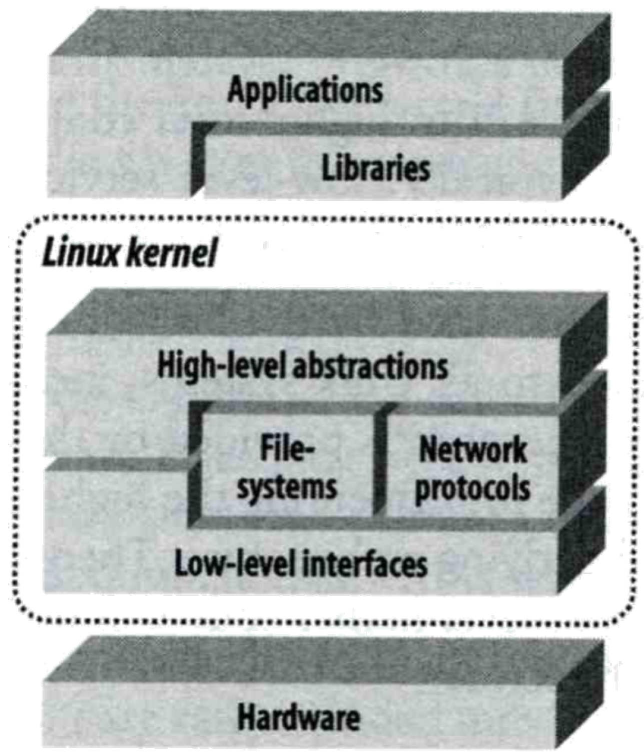
Introduction
– APRANET





Introduction
– Why TCP/IP ?

- The gap between applications and Network
  - Network
    - 802.3 Ethernet
    - 802.4 Token bus
    - 802.5 Token Ring
    - 802.11 Wireless
  - Application
    - Reliable
    - Performance



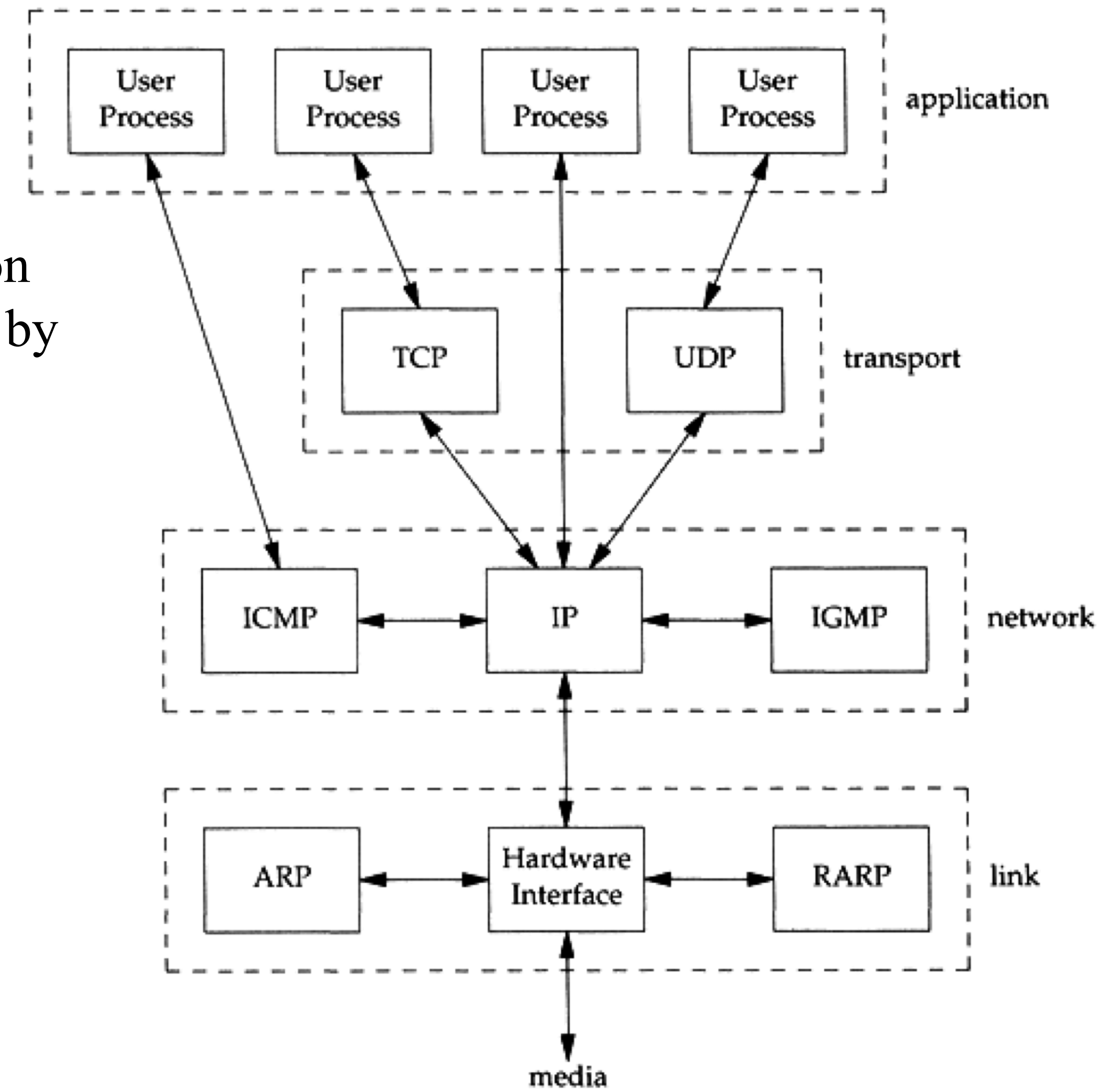
We need something to do the translating work!
TCP/IP it is!!

Introduction
– Layers of TCP/IP (1)

- TCP/IP is a suite of networking protocols
  - 4 layers Layering architecture
    - Link layer (data-link layer)
      - Include device drivers to handle hardware details
    - Network layer (IP)
      - Handle the movement of packets around the network
    - Transport layer (Port)
      - Handle flow of data between hosts
    - Application

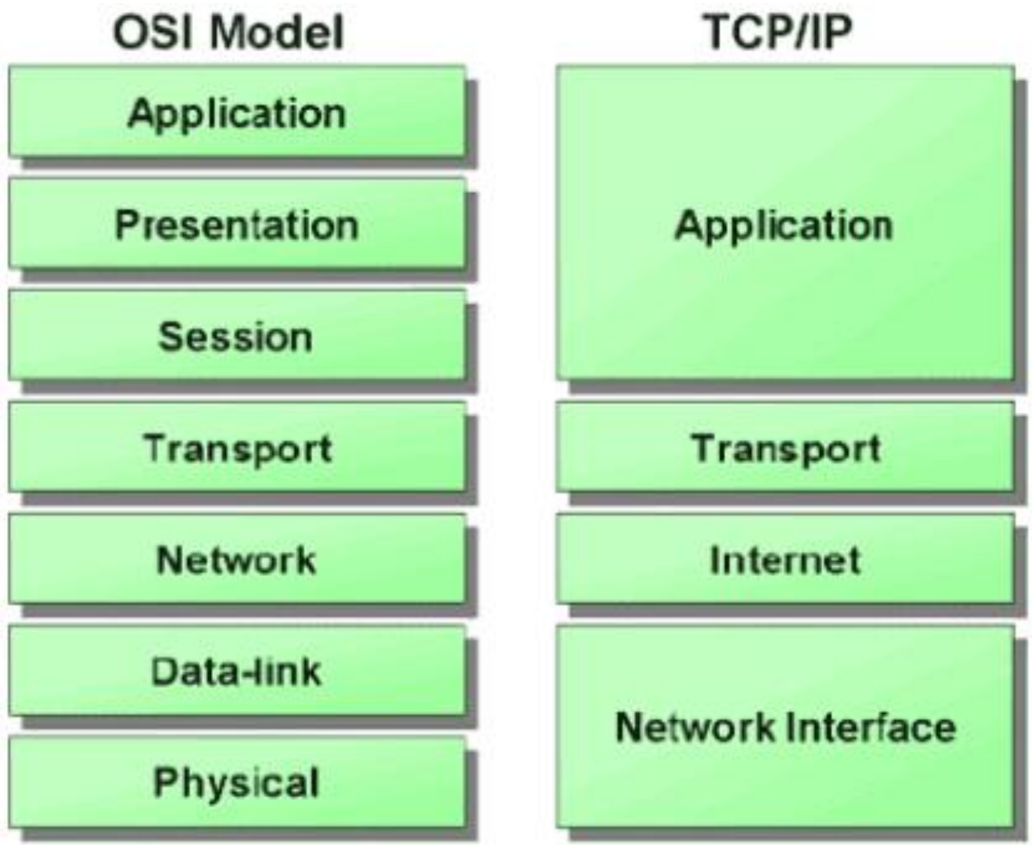
Introduction
– Layers of TCP/IP (2)

- Each layer has several protocols
  - A layer define a data communication function that may be performed by certain protocols
  - A protocol provides a service suitable to the function of that layer



Introduction
– Layers of TCP/IP (3)

- ISO/OSI Model
- TCP/IP Model



TCP/IP and the OSI model

ISO: International Organization for Standardization
OSI: Open System Interconnection

Introduction

- TCP/IP
  - Used to provide data communication between hosts
    - How to delivery data reliably
    - How to address remote host on the network
    - How to handle different type of hardware device

Introduction
– Addressing

- Addressing
  - MAC Address
    - Media Access Control Address
    - 48-bit Network Interface Card Hardware Address
      - 24-bit manufacture ID
      - 24-bit serial number
    - Ex:
      - 00:07:e9:10:e6:6b
  - IP Address
    - 32-bit Internet Address (IPv4)
    - Ex:
      - 140.113.209.64
  - Port
    - 16-bit uniquely identify application (1 ~ 65536)
    - Ex:
      - FTP port 21, SSH port 22, Telnet port 23

```
sabsd [/home/chwong] -chwong- ifconfig
sk0: flags=8843<UP,BROADCAST,RUNNING,SIMPLEX,MULTICAST> mtu 1500
        options=b<RXCSUM,TXCSUM,VLAN_MTU>
        inet 140.113.17.215 netmask 0xffffff00 broadcast 140.113.17.255
        inet 140.113.17.221 netmask 0xffffffff broadcast 140.113.17.221
        ether 00:11:d8:06:1e:81
        media: Ethernet autoselect (100baseTX <full-duplex,flag0,flag1>)
        status: active
lo0: flags=8049<UP,LOOPBACK,RUNNING,MULTICAST> mtu 16384
        inet 127.0.0.1 netmask 0xff000000
```

Link Layer

Link Layer
– Introduction of Link Layer

- ❑ Purpose of the link layer
  - Send and receive IP datagram for IP module
  - ARP request and reply
  - RARP request and reply

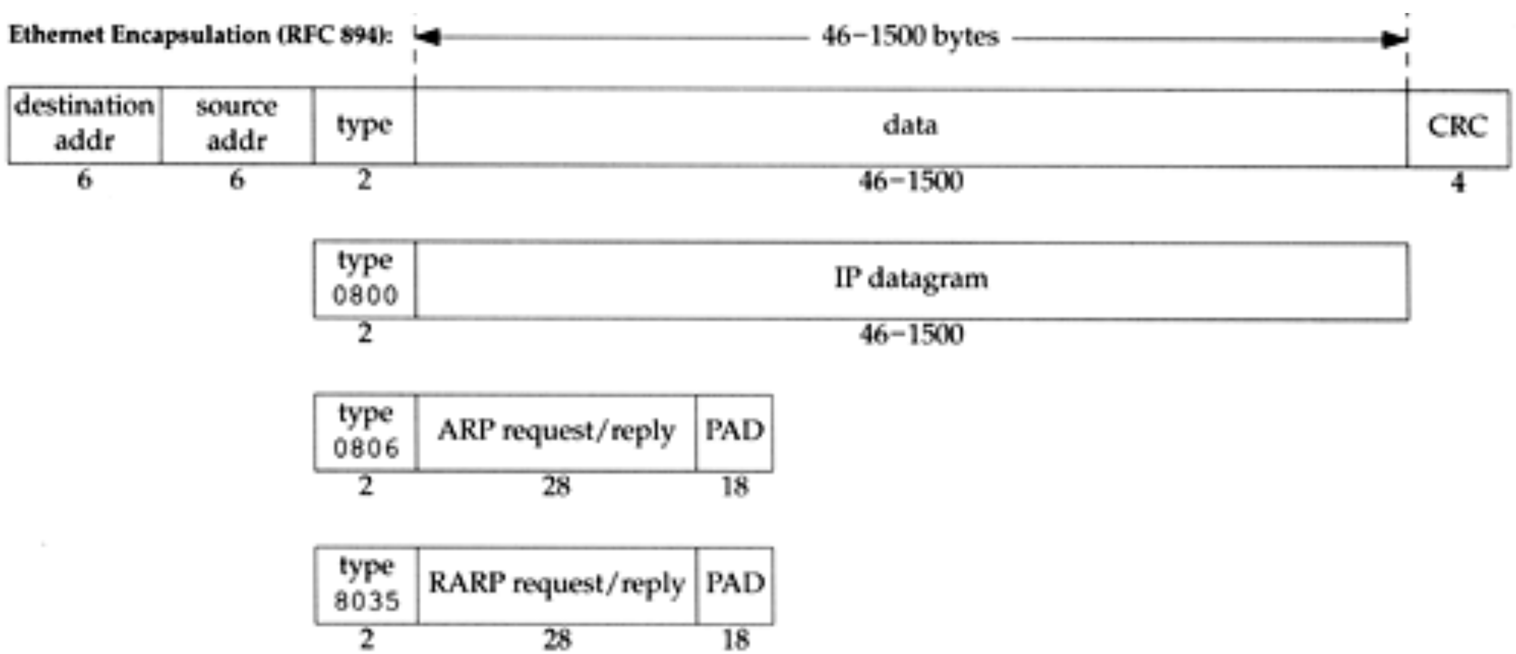
- ❑ TCP/IP support various link layers, depending on the type of hardware used:
  - Ethernet
    - ➢ Teach in this class
  - Token Ring
  - FDDI (Fiber Distributed Data Interface)
  - Serial Line

Link Layer
– Ethernet

- Features
  - Predominant form of local LAN technology used today
  - Use CSMA/CD
    - Carrier Sense, Multiple Access with Collision Detection
  - Use 48-bit MAC address
  - Operate at 10 Mbps
    - Fast Ethernet at 100 Mbps
    - Gigabit Ethernet at 1000 Mbps
    - 10 Gigabit Ethernet at 10,000 Mbps (10Gbps)
  - Ethernet frame format is defined in RFC 894
    - This is the actually used format in reality

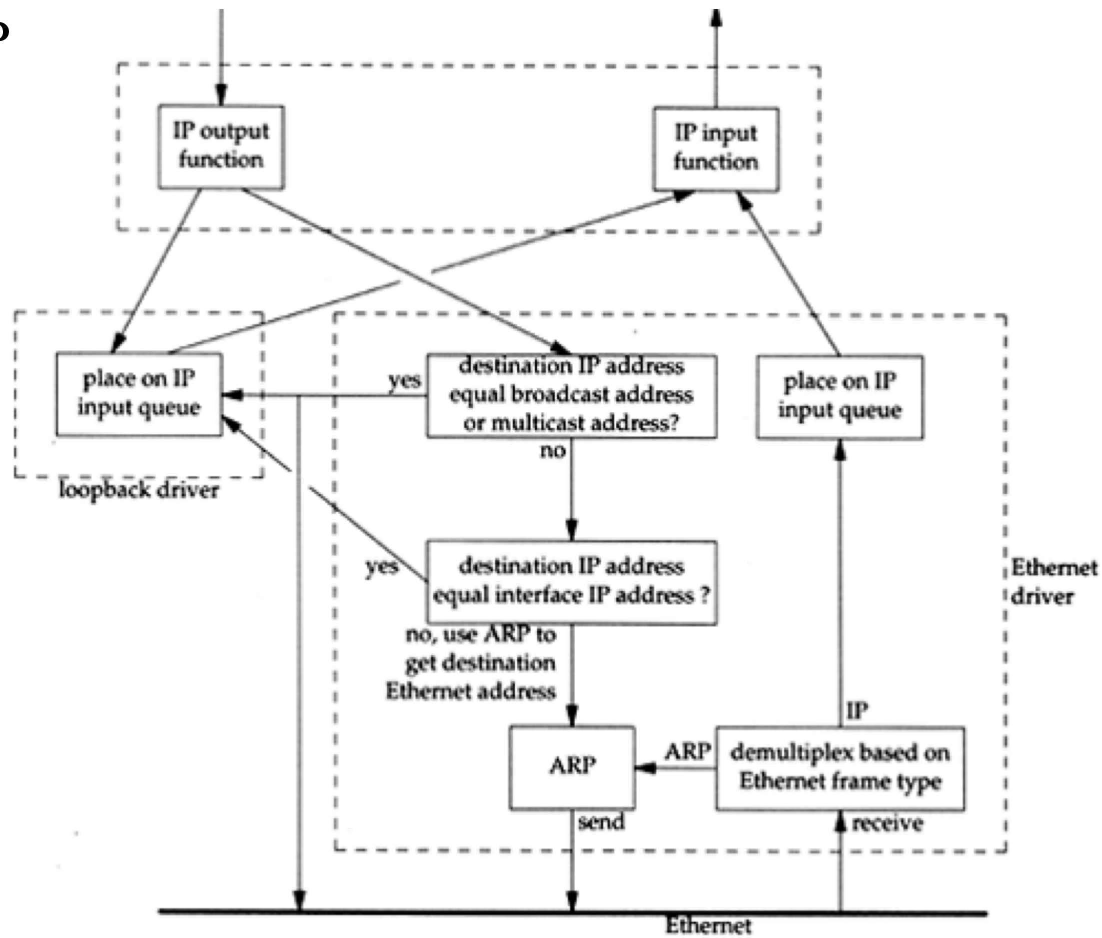
Link Layer
– Ethernet Frame Format

- 48-bit hardware address
  - For both destination and source address
- 16-bit type is used to specify the type of following data
  - 0800 → IP datagram
  - 0806 → ARP, 8035 → RARP



Link Layer
– Loopback Interface

- Pseudo NIC
  - Allow client and server on the same host to communicate with each other using TCP/IP
  - IP
    - 127.0.0.1
  - Hostname
    - localhost



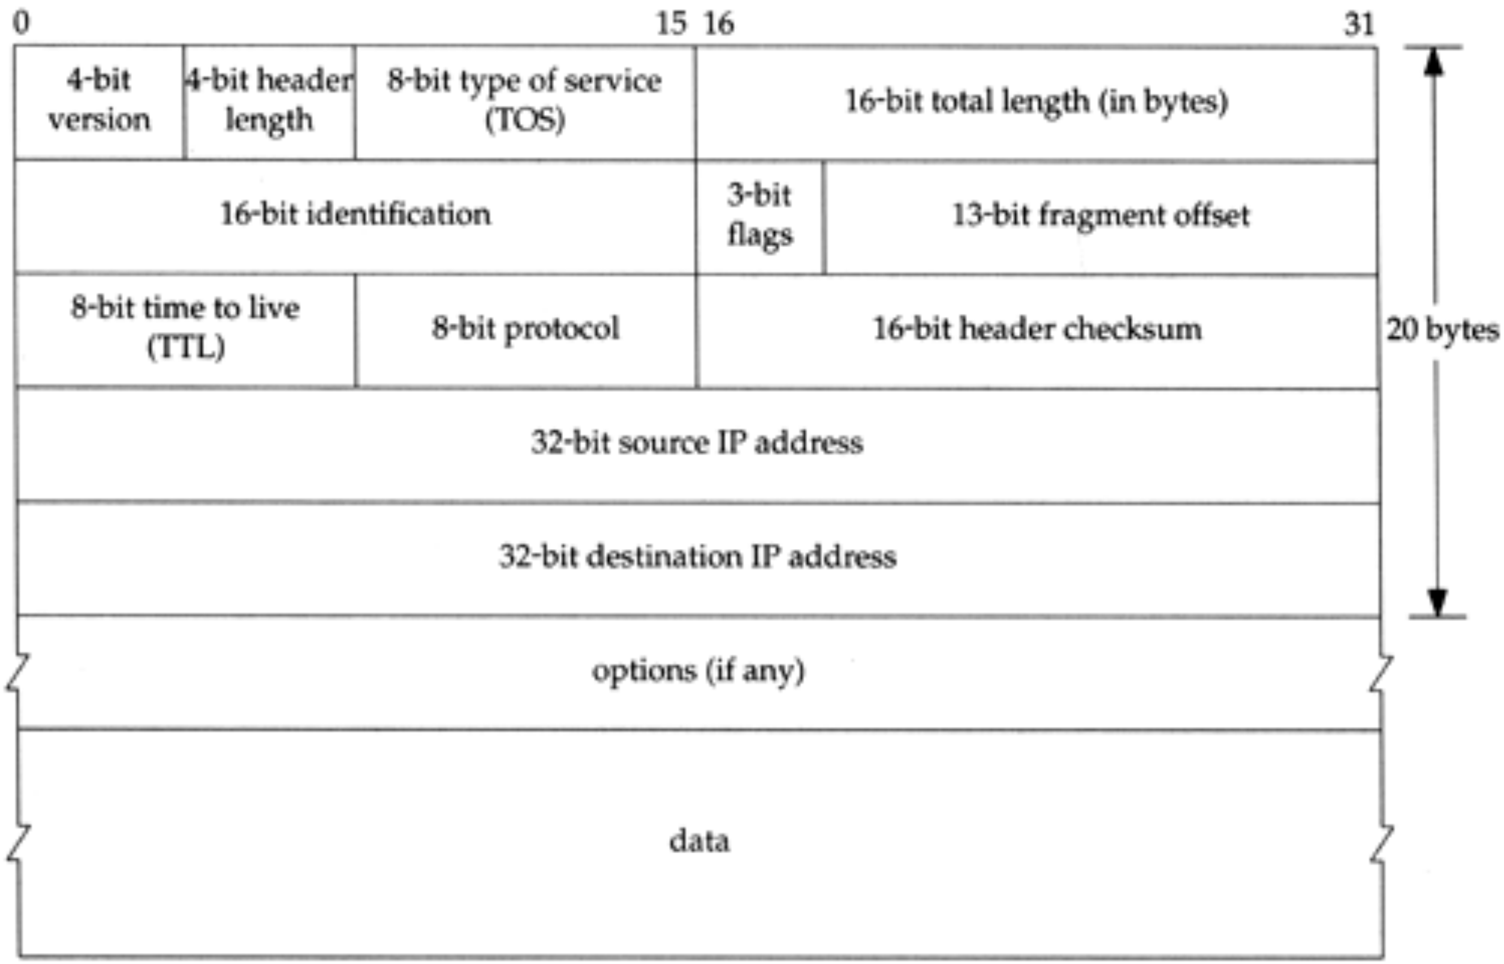
Network Layer

Network Layer
– Introduction to Network Layer

- Unreliable and connectionless datagram delivery service
  - IP Routing
  - IP provides best effort service (unreliable)
  - IP datagram can be delivered out of order (connectionless)
- Protocols using IP
  - TCP, UDP, ICMP, IGMP

Network Layer – IP Header

- 20 bytes in total length, excepts options



Network Layer – IP Address (1)

- 32-bit long
  - Network part
    - Identify a logical network
  - Host part
    - Identify a machine on certain network
- Ex:
  - NCTU
    - Class B address: 140.113.0.0
    - Network ID: 140.113
    - Number of hosts: 256*256 = 65536
- IP address category

Class	1st byte[a]	Format	Comments
A	1-126	N.H.H.H	Very early networks, or reserved for DOD
B	128-191	N.N.H.H	Large sites, usually subnetted, were hard to get
C	192-223	N.N.N.H	Easy to get, often obtained in sets
D	224-239	–	Multicast addresses, not permanently assigned
E	240-254	–	Experimental addresses

a. The values 0 and 255 are special and are not used as the first byte of regular IP addresses. 127 is reserved for the loopback address.

Network Layer
– Subnetting, CIDR, and Netmask (1)

- Problems of Class A or B network
  - Number of hosts is enormous
  - Hard to maintain and management
  - Solution → Subnetting

- Problems of Class C network
  - 255*255*255 number of Class C network make the size of Internet routes huge
  - Solution → Classless Inter-Domain Routing

Network Layer – Subnetting, CIDR, and Netmask (2)

- Subnetting
  - Borrow some bits from host ID to extend network ID
  - Ex:
    - Class B address : 140.113.0.0
      = 256 Class C-like IP addresses
      in N.N.N.H subnetting method
    - 140.113.209.0 subnet
  - Benefits of subnetting
    - Reduce the routing table size of Internet's routers
    - Ex:
      - All external routers have only one entry for 140.113 Class B network

Network Layer – Subnetting, CIDR, and Netmask (3)

- Netmask
  - Specify how many bits of network-ID are used for network-ID
  - Continuous 1 bits form the network part
  - Ex:
    - 255.255.255.0 in NCTU-CS example
      - 256 hosts available
    - 255.255.255.248 in ADSL example
      - Only 8 hosts available
  - Shorthand notation
    - Address/prefix-length
      - Ex: 140.113.209.8/24

Network Layer – Subnetting, CIDR, and Netmask (4)

- How to determine your network ID?
  - Bitwise-AND IP and netmask
  - Ex:
    - **140.113.214.37 & 255.255.255.0 → 140.113.214.0**
    - **140.113.209.37 & 255.255.255.0 → 140.113.209.0**
    - **140.113.214.37 & 255.255.0.0 → 140.113.0.0**
    - **140.113.209.37 & 255.255.0.0 → 140.113.0.0**
    - **211.23.188.78 & 255.255.255.248 → 211.23.188.72**
      - **78 = 01001110**
      - **78 & 248= 01001110 & 11111000 =72**

Network Layer – Subnetting, CIDR, and Netmask (5)

- In a subnet, not all IP are available
  - The first one IP ➔ network ID
  - The last one IP ➔ broadcast address
  - Ex:

Netmask 255.255.255.0 140.113.209.32/24 140.113.209.0 ➔ network ID 140.113.209.255 ➔ broadcast address 1 ~ 254, total 254 IPs are usable	Netmask 255.255.255.252 211.23.188.78/29 211.23.188.72 ➔ network ID 211.23.188.79 ➔ broadcast address 73 ~ 78, total 6 IPs are usable

Network Layer
– Subnetting, CIDR, and Netmask (6)

- The smallest subnetting
  - Network portion : 30 bits
  - Host portion : 2 bits
  - ➔ 4 hosts, but only 2 IPs are available
- ipcalc
  - /usr/ports/net-mgmt/ipcalc
  - pkg install ipcalc

```
chbsd [/usr/ports/net-mgmt/ipcalc] -chwong- ipcalc 140.113.209.78/28
Address:   140.113.209.78         10001100.01110001.11010001.0100 1110
Netmask:   255.255.255.240 = 28   11111111.11111111.11111111.1111 0000
Wildcard:  0.0.0.15               00000000.00000000.00000000.0000 1111
=>
Network:   140.113.209.64/28      10001100.01110001.11010001.0100 0000
HostMin:   140.113.209.65         10001100.01110001.11010001.0100 0001
HostMax:   140.113.209.78         10001100.01110001.11010001.0100 1110
Broadcast: 140.113.209.79         10001100.01110001.11010001.0100 1111
Hosts/Net: 14                      Class B
```

Network Layer – Subnetting, CIDR, and Netmask (7)

- Network configuration for various lengths of netmask

Length[a]	Host bits	Hosts/net[b]	Dec. netmask	Hex netmask
/20	12	4094	255.255.240.0	0xFFFFF000
/21	11	2046	255.255.248.0	0xFFFFF800
/22	10	1022	255.255.252.0	0xFFFFFC00
/23	9	510	255.255.254.0	0xFFFFFE00
/24	8	254	255.255.255.0	0xFFFFFF00
/25	7	126	255.255.255.128	0xFFFFFF80
/26	6	62	255.255.255.192	0xFFFFFFC0
/27	5	30	255.255.255.224	0xFFFFFFE0
/28	4	14	255.255.255.240	0xFFFFFFF0
/29	3	6	255.255.255.248	0xFFFFFFF8
/30	2	2	255.255.255.252	0xFFFFFFFC

Network Layer – Subnetting, CIDR, and Netmask (8)

- CIDR (Classless Inter-Domain Routing)
  - Use address mask instead of old address classes to determine the destination network
  - CIDR requires modifications to routers and routing protocols
    - Need to transmit both destination address and mask
  - Ex:
    - We can merge two Class C network:
      203.19.68.0/24, 203.19.69.0/24 → 203.19.68.0/23
  - Benefit of CIDR
    - We can allocate continuous Class C network to organization
      - Reflect physical network topology
      - Reduce the size of routing table

Network Layer – IP Routing (1)

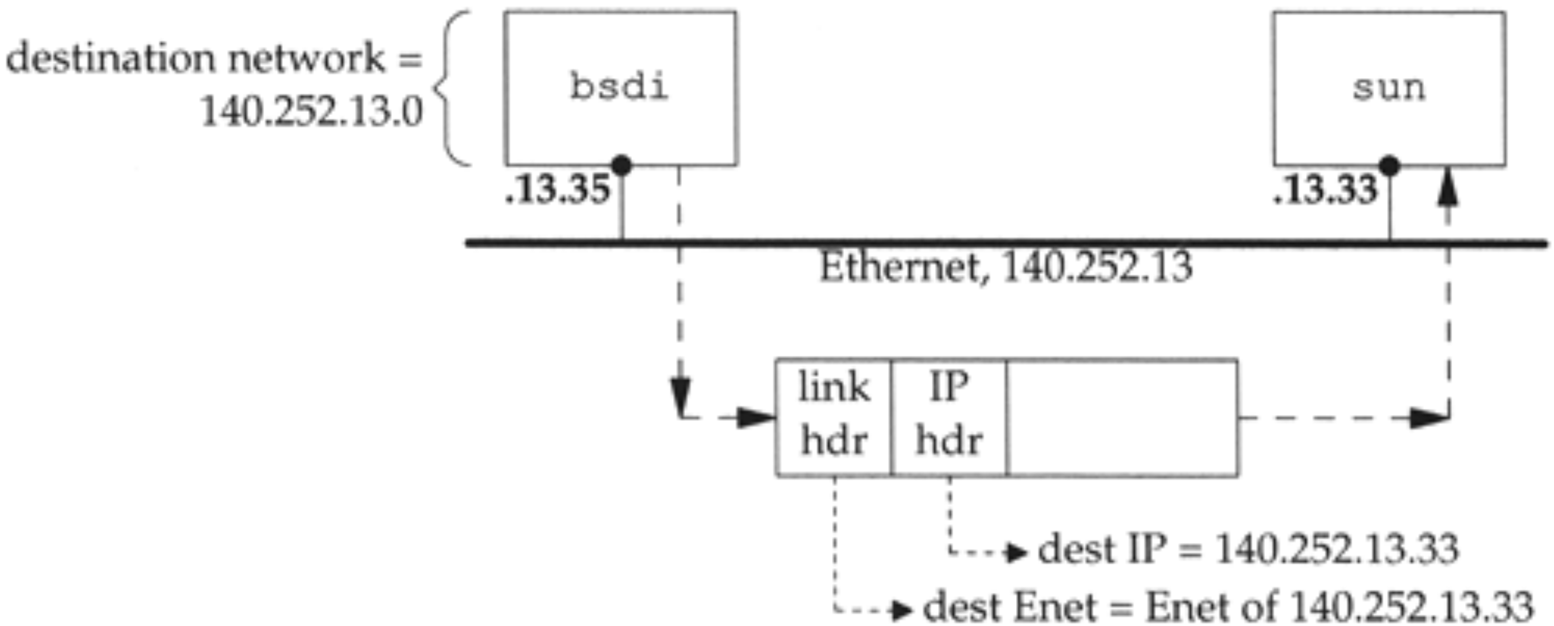
- Difference between Host and Router
  - Router forwards datagram from one of its interface to another, while host does not
  - Almost every Unix system can be configured to act as a router or both
    - net.inet.ip.forwarding=1
- Router
  - IP layer has a routing table, which is used to store the information for forwarding datagram
  - When router receiving a datagram
    - If Dst. IP = my IP, demultiplex to other protocol
    - Other, forward the IP based on routing table

Network Layer – IP Routing (2)

- Routing table information
  - Destination IP
  - IP address of next-hop router or IP address of a directly connected network
  - Flags
  - Next interface
- IP routing
  - Done on a hop-by-hop basis
  - It assumes that the next-hop router is closer to the destination
  - Steps:
    - Search routing table for complete matched IP address
      - Send to next-hop router or to the directly connected NIC
    - Search routing table for matched network ID
      - Send to next-hop router or to the directly connected NIC
    - Search routing table for default route
      - Send to this default next-hop router
    - host or network unreachable

Network Layer
– IP Routing (3)

- Ex1: routing in the same network
  - bsdi: 140.252.13.35
  - sun: 140.252.13.33

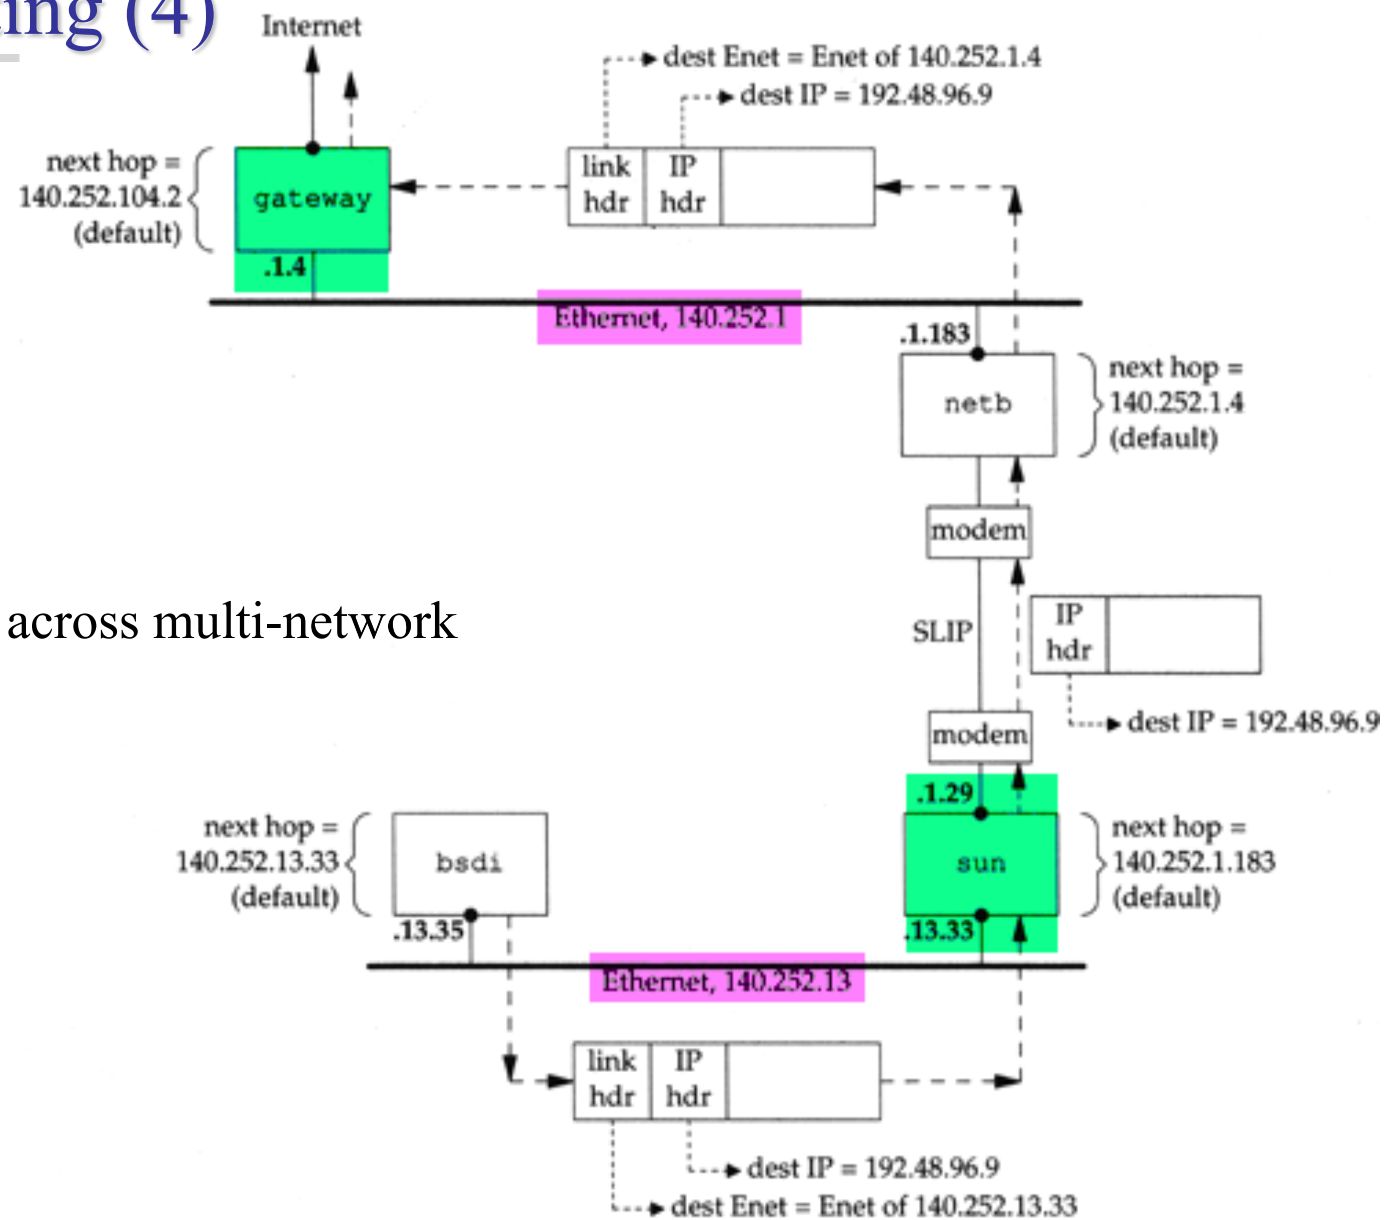


Ex Routing table:

140.252.13.33	00:d0:59:83:d9:16	UHLW	fxp1

Network Layer – IP Routing (4)

- Ex2:
  - routing across multi-network



ARP and RARP

Something between

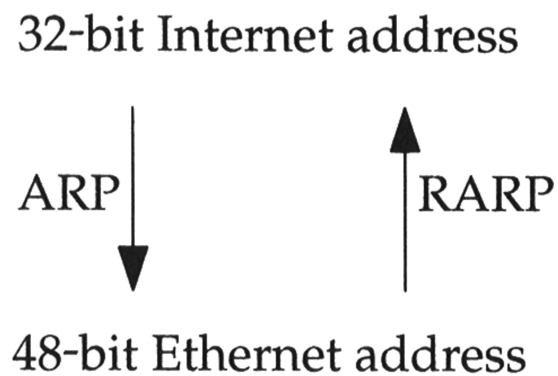
MAC (link layer)

And

IP (network layer)

ARP and RARP

- ARP – Address Resolution Protocol and
  RARP – Reverse ARP
  - Mapping between IP and Ethernet address



- When an Ethernet frame is sent on LAN from one host to another,
  - It is the 48-bit Ethernet address that determines for which interface the frame is destined

ARP and RARP – ARP Example

- Example

  % ftp bsd1

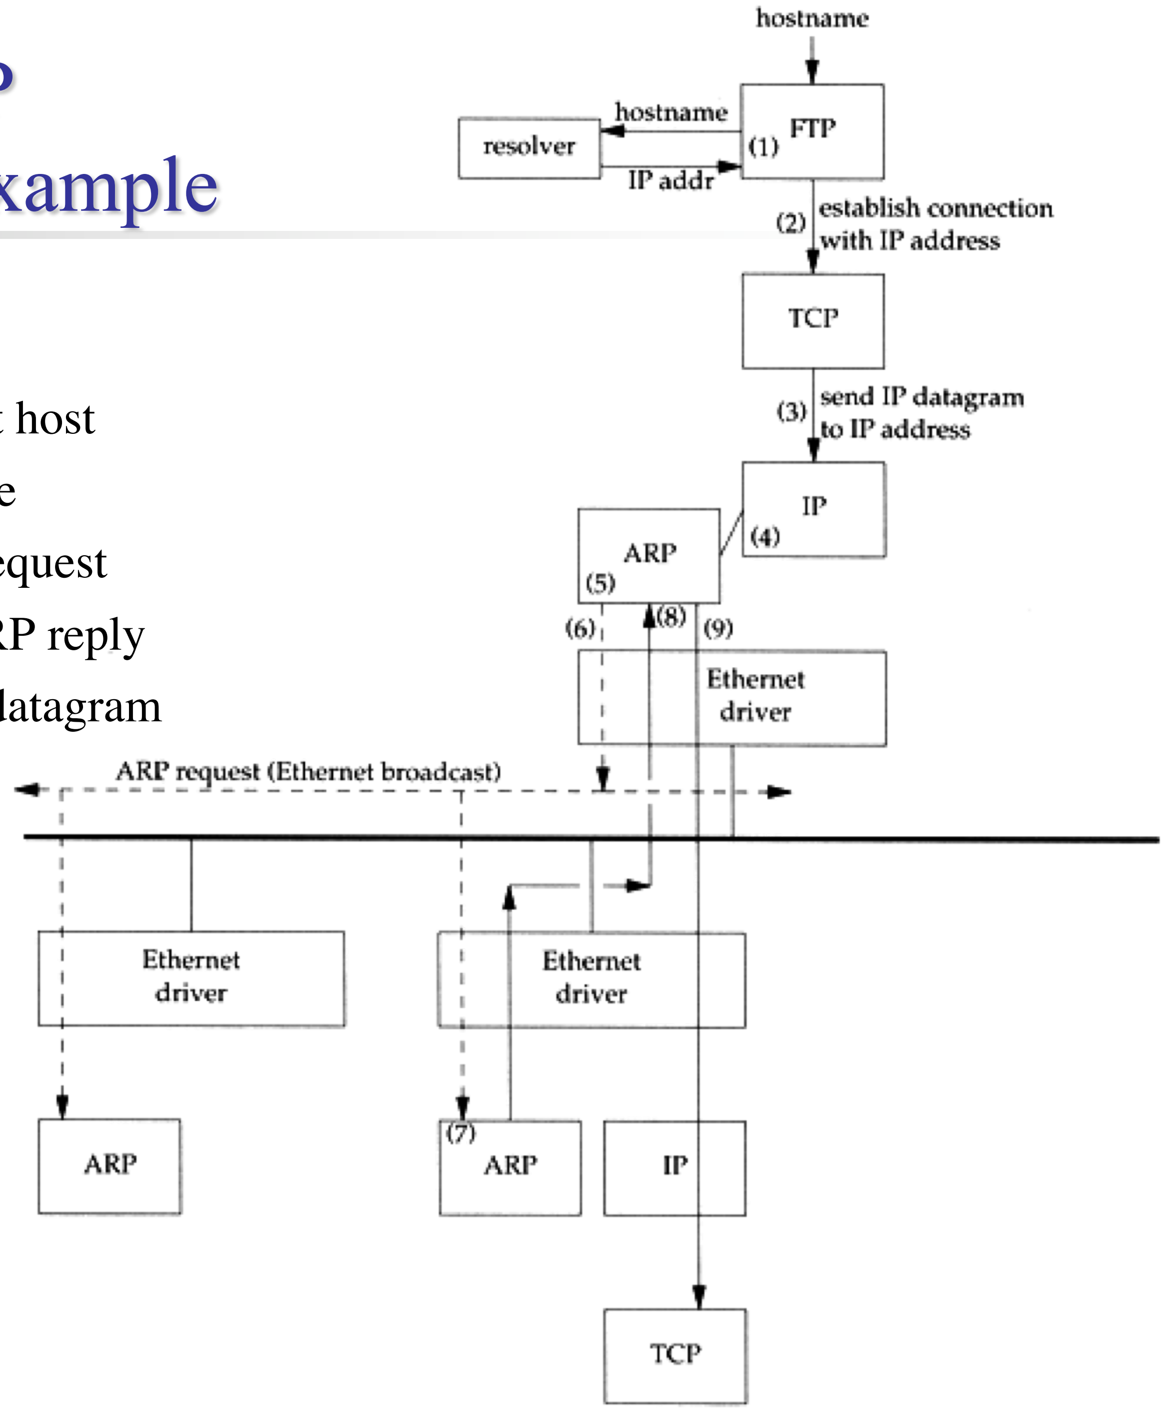
  (4) next-hop or direct host

  (5) Search ARP cache

  (6) Broadcast ARP request

  (7) bsd1 response ARP reply

  (9) Send original IP datagram

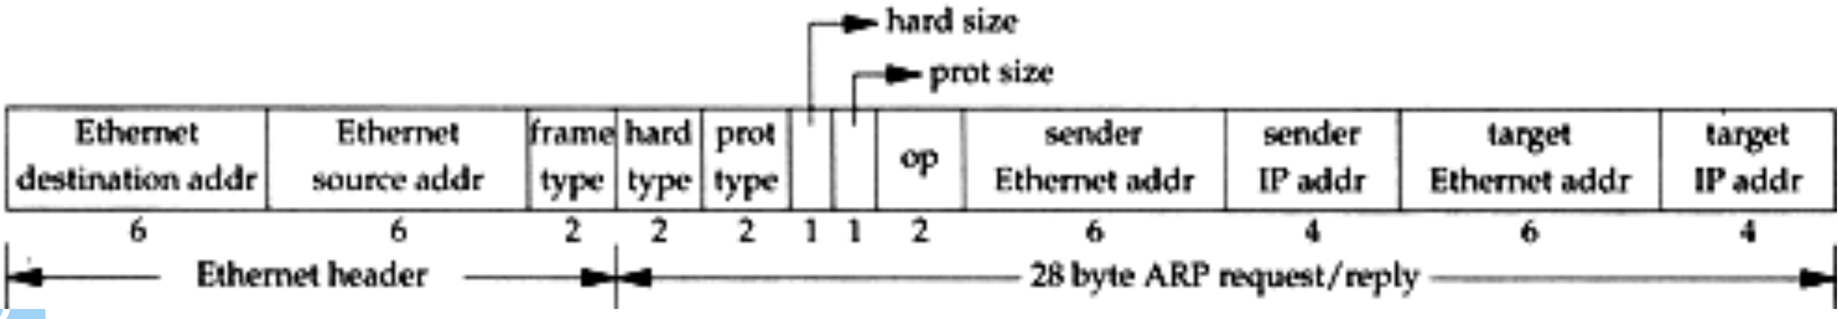


ARP and RARP – ARP Cache

- Maintain recent ARP results
  - come from both ARP request and reply
  - expiration time
    - Complete entry = 20 minutes
    - Incomplete entry = 3 minutes
  - Use arp command to see the cache
  - Ex:
    - % arp -a
    - % arp -da
    - % arp -S 140.113.235.132 00:0e:a6:94:24:6e

```
csduty /home/chwong] -chwong- arp -a
cshome (140.113.235.101) at 00:0b:cd:9e:74:61 on em0 [ethernet]
bsd1 (140.113.235.131) at 00:11:09:a0:04:74 on em0 [ethernet]
? (140.113.235.160) at (incomplete) on em0 [ethernet]
```

ARP and RARP
– ARP/RARP Packet Format



- ❑ Ethernet destination addr: all 1′s (broadcast)
- ❑ Known value for IP <-> Ethernet
  - Frame type: 0x0806 for ARP, 0x8035 for RARP
  - Hardware type: type of hardware address (1 for Ethernet)
  - Protocol type: type of upper layer address (0x0800 for IP)
  - Hard size: size in bytes of hardware address (6 for Ethernet)
  - Protocol size: size in bytes of upper layer address (4 for IP)
  - Op: 1, 2, 3, 4 for ARP request, reply, RARP request, reply

ARP and RARP – Use tcpdump to see ARP

- Host 140.113.17.212 → 140.113.17.215
  - Clear ARP cache of 140.113.17.212
    - % sudo arp -d 140.113.17.215
  - Run tcpdump on 140.113.17.215 (**00:11:d8:06:1e:81**)
    - % sudo tcpdump -i sk0 -e arp
    - % sudo tcpdump -i sk0 -n -e arp
    - % sudo tcpdump -i sk0 -n -t -e arp
  - On 140.113.17.212, ssh to 140.113.17.215

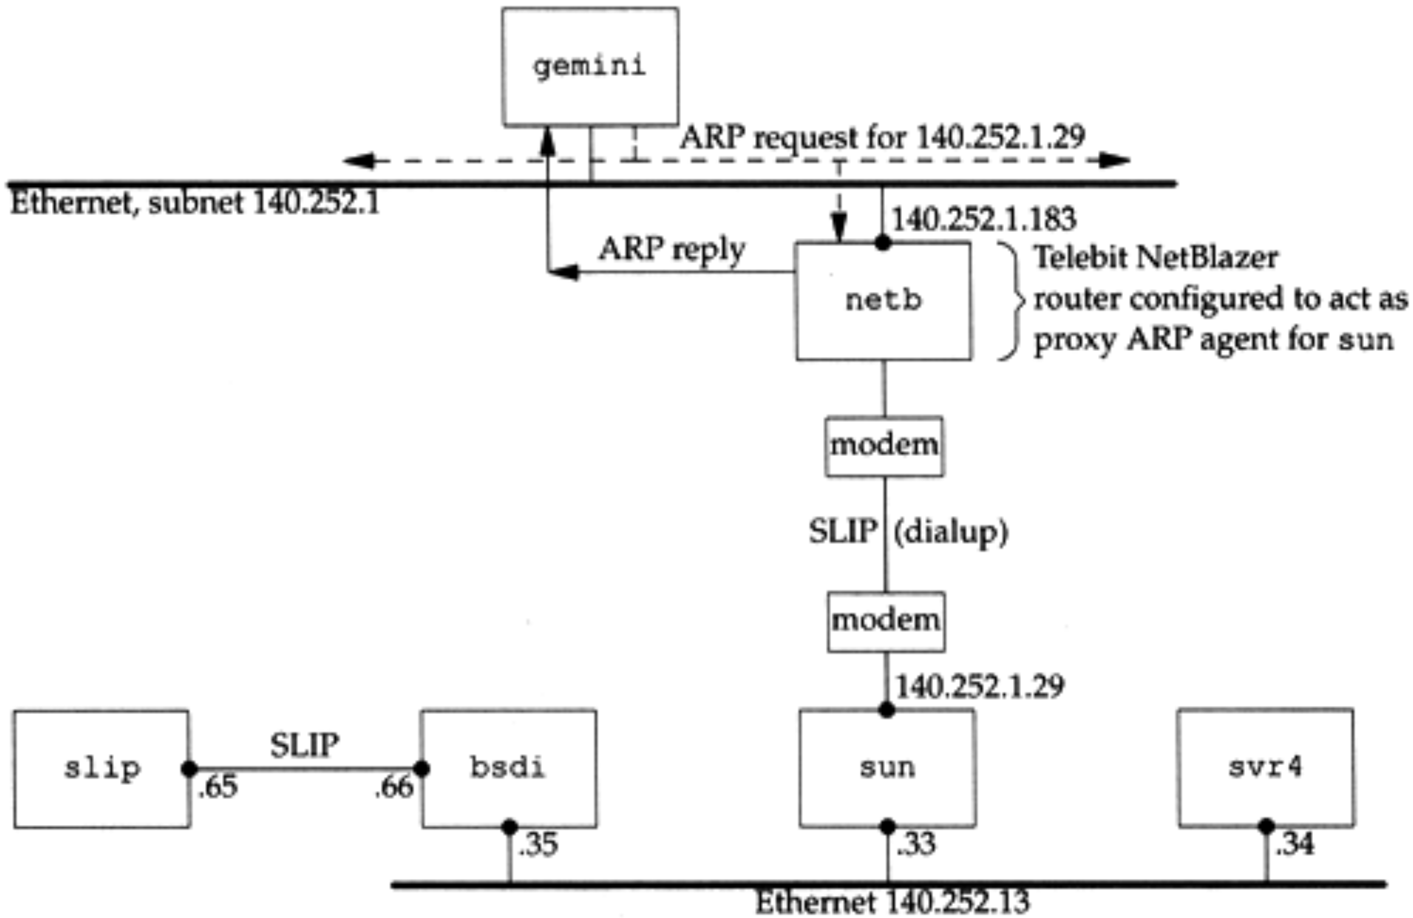
```
15:18:54.899779 00:90:96:23:8f:7d > Broadcast, ethertype ARP (0x0806), length 60:
    arp who-has nabsd tell chbsd.csie.nctu.edu.tw
15:18:54.899792 00:11:d8:06:1e:81 > 00:90:96:23:8f:7d, ethertype ARP (0x0806), length 42:
    arp reply nabsd is-at 00:11:d8:06:1e:81
```

```
15:26:13.847417 00:90:96:23:8f:7d > ff:ff:ff:ff:ff:ff, ethertype ARP (0x0806), length 60:
    arp who-has 140.113.17.215 tell 140.113.17.212
15:26:13.847434 00:11:d8:06:1e:81 > 00:90:96:23:8f:7d, ethertype ARP (0x0806), length 42:
    arp reply 140.113.17.215 is-at 00:11:d8:06:1e:81
```

```
00:90:96:23:8f:7d > ff:ff:ff:ff:ff:ff, ethertype ARP (0x0806), length 60:
    arp who-has 140.113.17.215 tell 140.113.17.212
00:11:d8:06:1e:81 > 00:90:96:23:8f:7d, ethertype ARP (0x0806), length 42:
    arp reply 140.113.17.215 is-at 00:11:d8:06:1e:81
```

ARP and RARP – Proxy ARP

- Let router answer ARP request on one of its networks for a host on another of its network



ARP and RARP – Gratuitous ARP

- Gratuitous ARP
  - The host sends an ARP request looking for its own IP
  - Provide two features
    - Used to determine whether there is another host configured with the same IP
    - Used to cause any other host to update ARP cache when changing hardware address

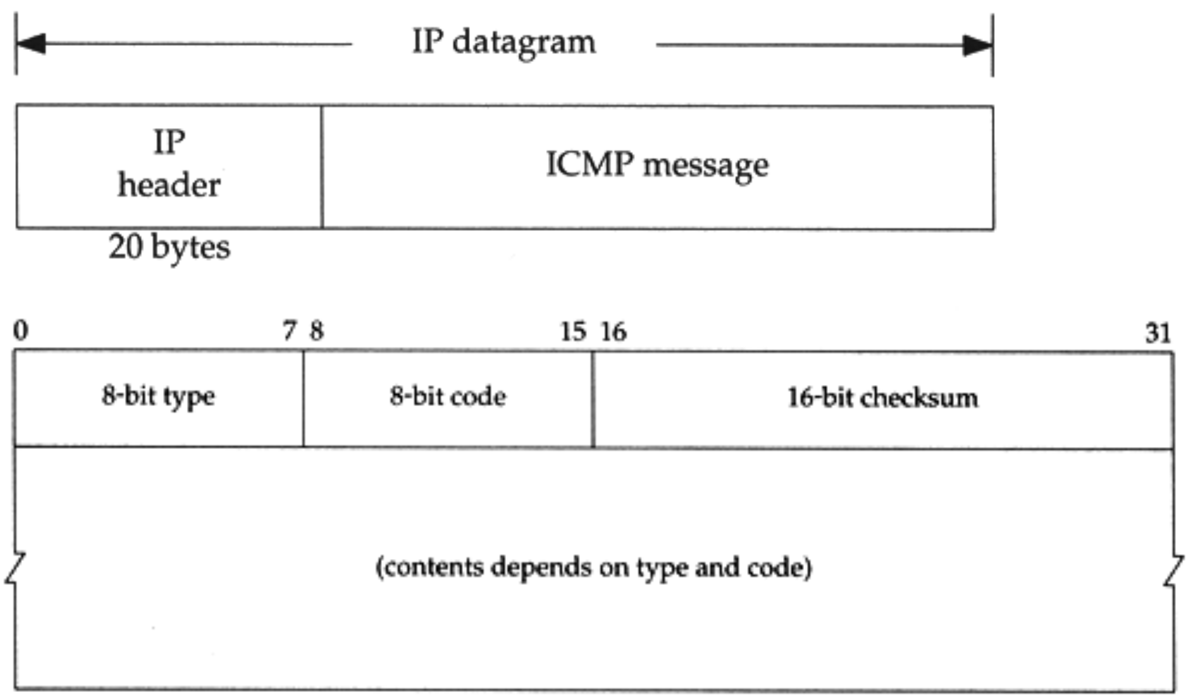
ARP and RARP – RARP

- Principle
  - Used for the diskless system to read its hardware address from the NIC and send an RARP request to gain its IP
- RARP Server Design
  - RARP server must maintain the map from hardware address to an IP address for many host
  - Link-layer broadcast
    - This prevent most routers from forwarding an RARP request

ICMP –
Internet Control Message Protocol

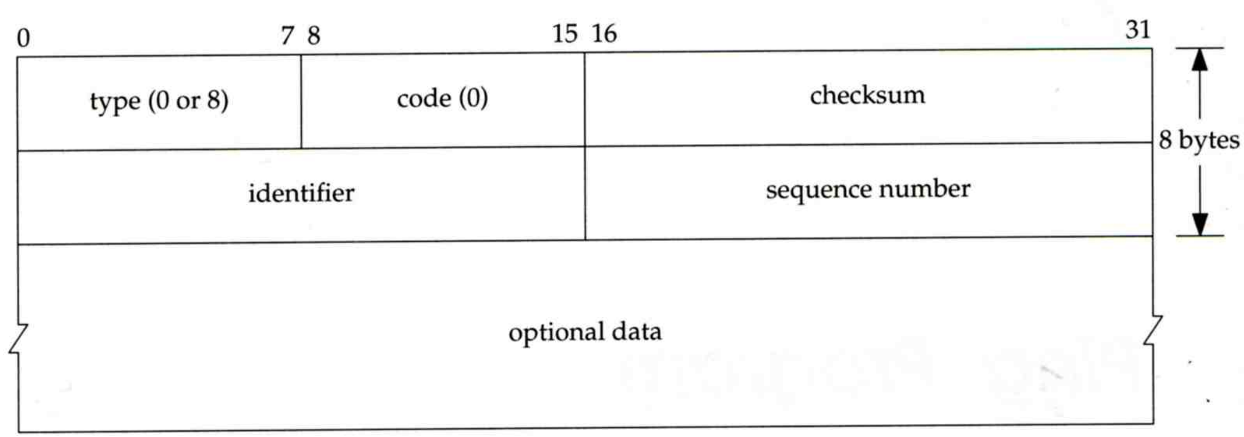
ICMP – Introduction

- Part of the IP layer
  - ICMP messages are transmitted within IP datagram
  - ICMP communicates error messages and other conditions that require attention for other protocols
- ICMP message format



ICMP
– Ping Program (1)

- ❑ Use ICMP to test whether another host is reachable
  - Type 8, ICMP echo request
  - Type 0, ICMP echo reply
- ❑ ICMP echo request/reply format
  - Identifier: process ID of the sending process
  - Sequence number: start with 0
  - Optional data: any optional data sent must be echoed



ICMP
– Ping Program (2)

- Ex:
  - chbsd ping nabsd
  - execute “tcpdump -i sk0 -X -e icmp” on nabsd

```
chbsd [/home/chwong] -chwong- ping nabsd
PING nabsd.cs.nctu.edu.tw (140.113.17.215): 56 data bytes
64 bytes from 140.113.17.215: icmp_seq=0 ttl=64 time=0.520 ms
```

```
15:08:12.631925 00:90:96:23:8f:7d > 00:11:d8:06:1e:81, ethertype IPv4 (0x0800), length 98:
   chbsd.csie.nctu.edu.tw > nabsd: ICMP echo request, id 56914, seq 0, length 64
      0x0000:  4500 0054 f688 0000 4001 4793 8c71 11d4  E..T....@.G..q..

      0x0050:  3435                                     45
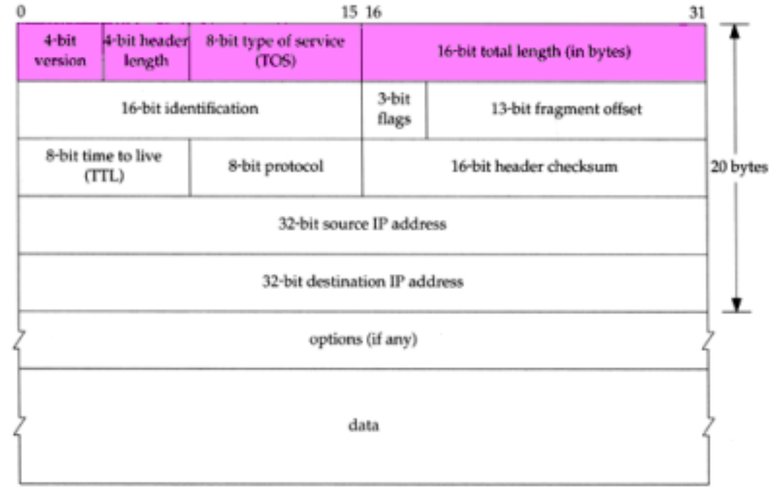
```

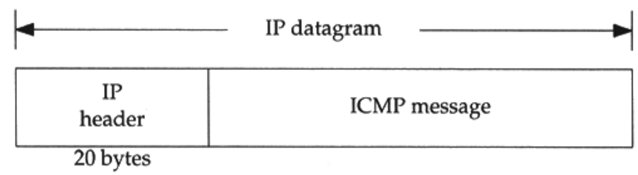
Type, Code

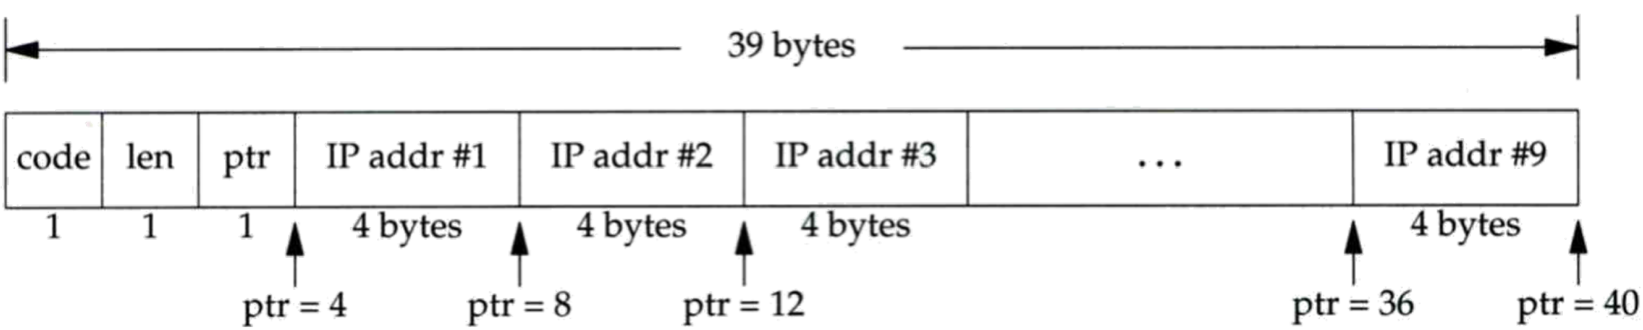
id

ICMP – Ping Program (3)



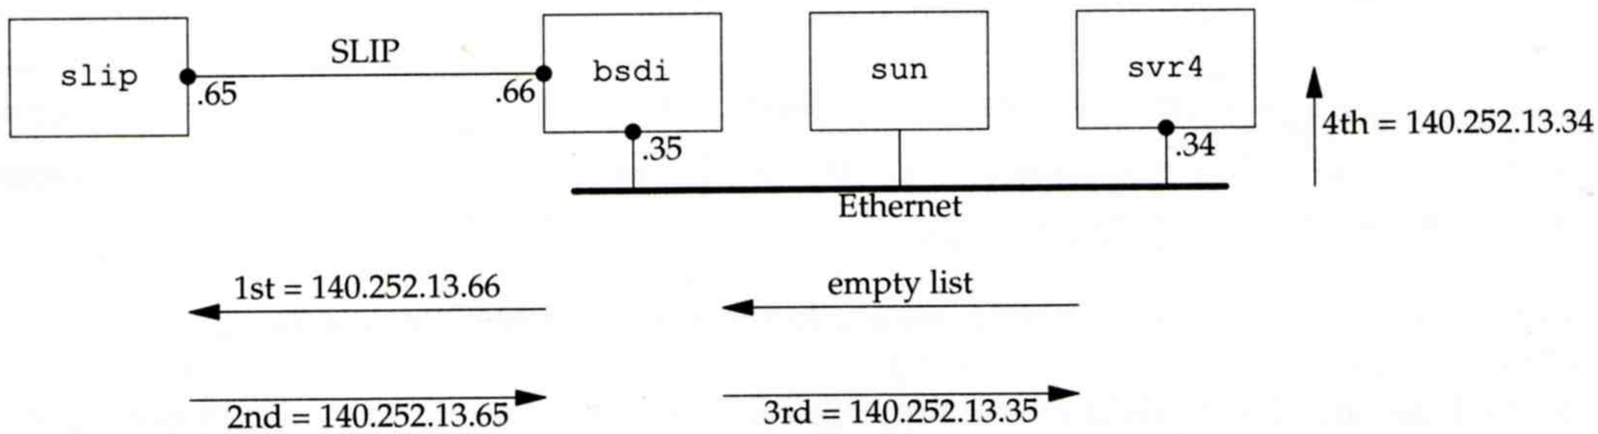
- To get the route that packets take to host
  - Taking use of "IP Record Route Option"
  - Command: ping -R
  - Cause every router that handles the datagram to add its (outgoing) IP address to a list in the options field.
  - Format of Option field for IP RR Option
    - code: type of IP Option (7 for RR)
    - len: total number of bytes of the RR option
    - ptr:4 ~ 40 used to point to the next IP address
  - Only 9 IP addresses can be stored
    - Limitation of IP header





ICMP
– Ping Program (4)

- Example:



```
svr4 % ping -R slip
PING slip (140.252.13.65): 56 data bytes
64 bytes from 140.252.13.65: icmp_seq=0 ttl=254 time=280 ms
RR:     bsdi (140.252.13.66)
        slip (140.252.13.65)
        bsdi (140.252.13.35)
        svr4 (140.252.13.34)

```

Traceroute Program (1)

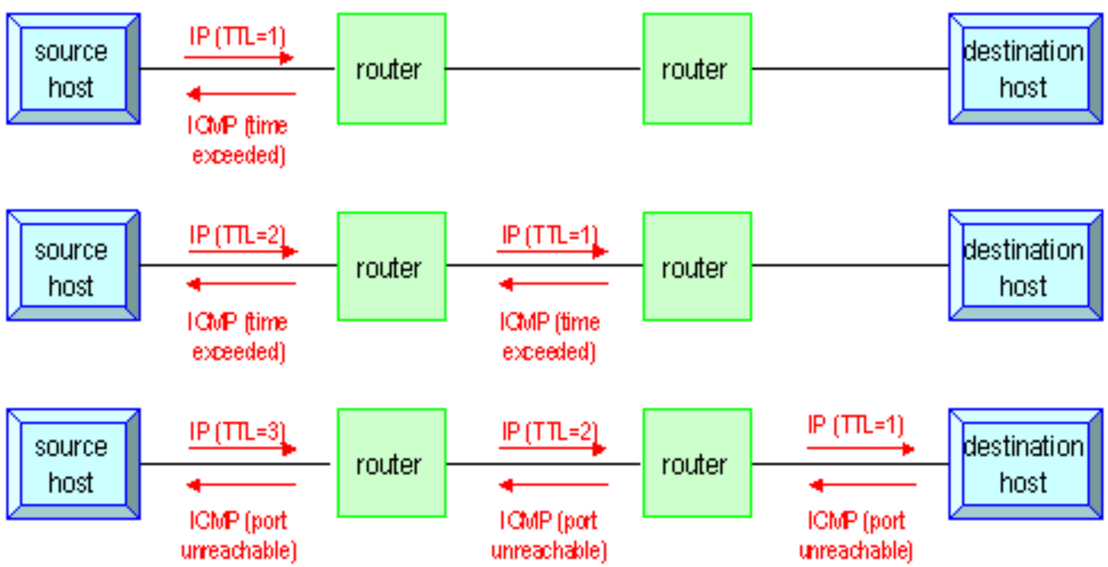
- To print the route packets take to network host

- Drawbacks of IP RR options (ping -R)
  - Not all routers have supported the IP RR option
  - Limitation of IP header length

- Background knowledge of traceroute
  - When a router receive a datagram, , it will decrement the TTL by one
  - When a router receive a datagram with TTL = 0 or 1,
    - it will through away the datagram and
    - sends back a "Time exceeded" ICMP message
  - Unused UDP port will generate a "port unreachable" ICMP message

Traceroute Program (2)

- Operation of traceroute
  - Send UDP with port > 30000, encapsulated with IP header with TTL = 1, 2, 3, … continuously
  - When router receives the datagram and TTL = 1, it returns a “Time exceed” ICMP message
  - When destination host receives the datagram and TTL = 1, it returns a “Port unreachable” ICMP message



Traceroute Program (3)

- Time exceed ICMP message
  - Type = 11, code = 0 or 1
    - Code = 0 means TTL=0 during transit
    - Code = 1 means TTL=0 during reassembly
  - First 8 bytes of datagram
    - UDP header

0	8	16	31
TYPE (11)	CODE (0 or 1)	CHECKSUM	
UNUSED (MUST BE ZERO)			
INTERNET HEADER + FIRST 64 BITS OF DATAGRAM			
. . .			

Traceroute Program (4)

- Ex:

```
nabsd [/home/chwong] -chwong- traceroute bsd1.cs.nctu.edu.tw
traceroute to bsd1.cs.nctu.edu.tw (140.113.235.131), 64 hops max, 40 byte packets
 1  e3rtn.csie.nctu.edu.tw (140.113.17.254)  0.377 ms  0.365 ms  0.293 ms
 2  ProjE27-254.NCTU.edu.tw (140.113.27.254)  0.390 ms  0.284 ms  0.391 ms
 3  140.113.0.58 (140.113.0.58)  0.292 ms  0.282 ms  0.293 ms
 4  140.113.0.165 (140.113.0.165)  0.492 ms  0.385 ms  0.294 ms
 5  bsd1.cs.nctu.edu.tw (140.113.235.131)  0.393 ms  0.281 ms  0.393 ms
```

```
nabsd [/home/chwong] -chwong- sudo tcpdump -i sk0 -t icmp
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on sk0, link-type EN10MB (Ethernet), capture size 96 bytes
IP e3rtn.csie.nctu.edu.tw > nabsd: ICMP time exceeded in-transit, length 36
IP e3rtn.csie.nctu.edu.tw > nabsd: ICMP time exceeded in-transit, length 36
IP e3rtn.csie.nctu.edu.tw > nabsd: ICMP time exceeded in-transit, length 36

IP ProjE27-254.NCTU.edu.tw > nabsd: ICMP time exceeded in-transit, length 36
IP ProjE27-254.NCTU.edu.tw > nabsd: ICMP time exceeded in-transit, length 36
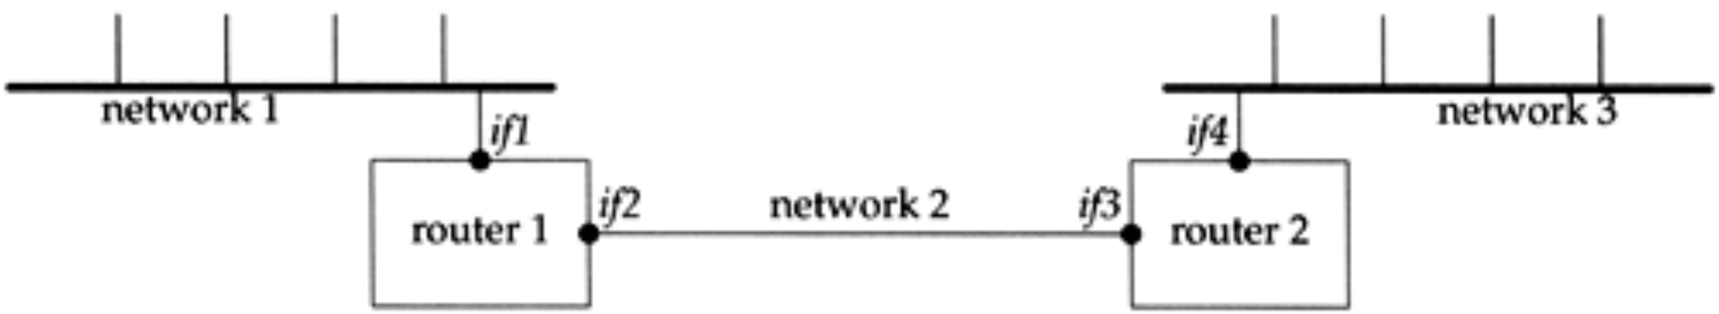
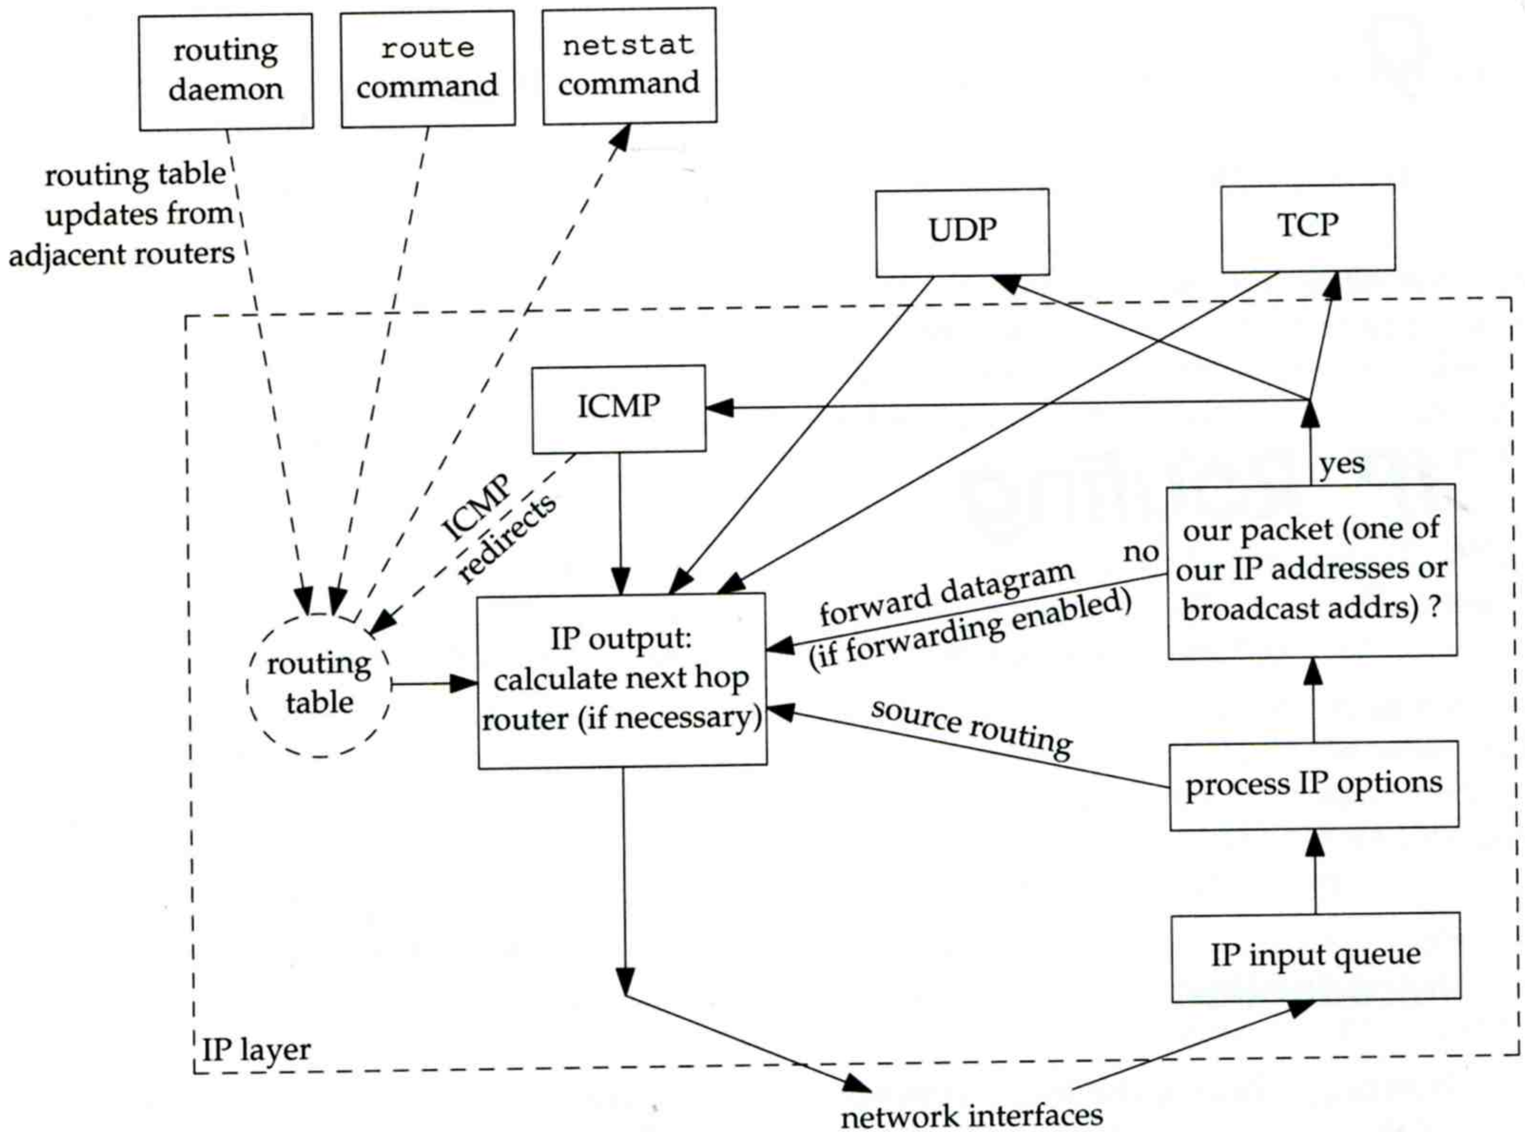
IP 140.113.0.58 > nabsd: ICMP time exceeded in-transit, length 36
IP 140.113.0.58 > nabsd: ICMP time exceeded in-transit, length 36
IP 140.113.0.58 > nabsd: ICMP time exceeded in-transit, length 36
IP 140.113.0.165 > nabsd: ICMP time exceeded in-transit, length 36
IP 140.113.0.165 > nabsd: ICMP time exceeded in-transit, length 36
IP 140.113.0.165 > nabsd: ICMP time exceeded in-transit, length 36
IP bsd1.cs.nctu.edu.tw > nabsd: ICMP bsd1.cs.nctu.edu.tw udp port 33447 unreachable, length 36
IP bsd1.cs.nctu.edu.tw > nabsd: ICMP bsd1.cs.nctu.edu.tw udp port 33448 unreachable, length 36
IP bsd1.cs.nctu.edu.tw > nabsd: ICMP bsd1.cs.nctu.edu.tw udp port 33449 unreachable, length 36
```

Traceroute Program (5)

- The router IP in traceroute is the interface that receives the datagram. (incoming IP)
  - Traceroute from left host to right host
    - if1, if3
  - Traceroute from right host to left host
    - if4, if2



IP Routing
– Processing in IP Layer



IP Routing
– Routing Table (1)

- Routing Table
  - Command to list: netstat -rn
  - Flag
    - U: the route is up
    - G: the route is to a router (indirect route)
      - Indirect route: IP is the dest. IP, MAC is the router's MAC
    - H: the route is to a host (Not to a network)
      - The dest. filed is either an IP address or network address
    - S: the route is static
  - Expire: expiration time for each route

```
nasa [/home/wangth] -wangth- netstat -rn
Routing tables

Internet:
Destination       Gateway           Flags     Netif     Expire
Default           140.113.17.254    UGS       em0
127.0.0.1         link#2            UH        lo0
140.113.17.0/24   link#1            U         em0
140.113.17.225    link#1            UHS       lo0
```

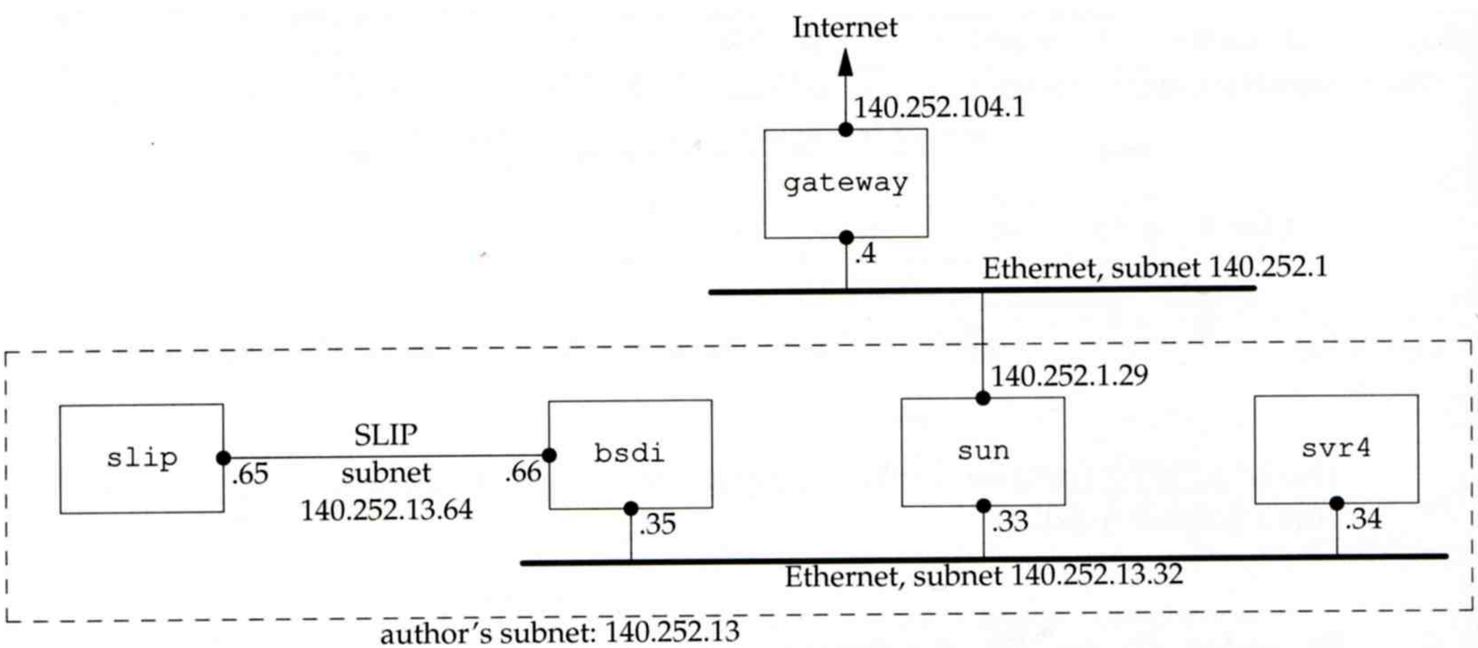
IP Routing
– Routing Table (2)

- Ex:

1. dst. = sun
2. dst. = slip
3. dst. = 192.207.117.2
4. dst. = svr4 or 140.252.13.34
5. dst. = 127.0.0.1

```
svr4 % netstat -rn
Routing tables
Destination        Gateway            Flags     Refcnt Use      Interface
140.252.13.65      140.252.13.35      UGH       0      0        emd0
127.0.0.1          127.0.0.1          UH        1      0        lo0
default            140.252.13.33      UG        0      0        emd0
140.252.13.32      140.252.13.34      U         4      25043    emd0
```

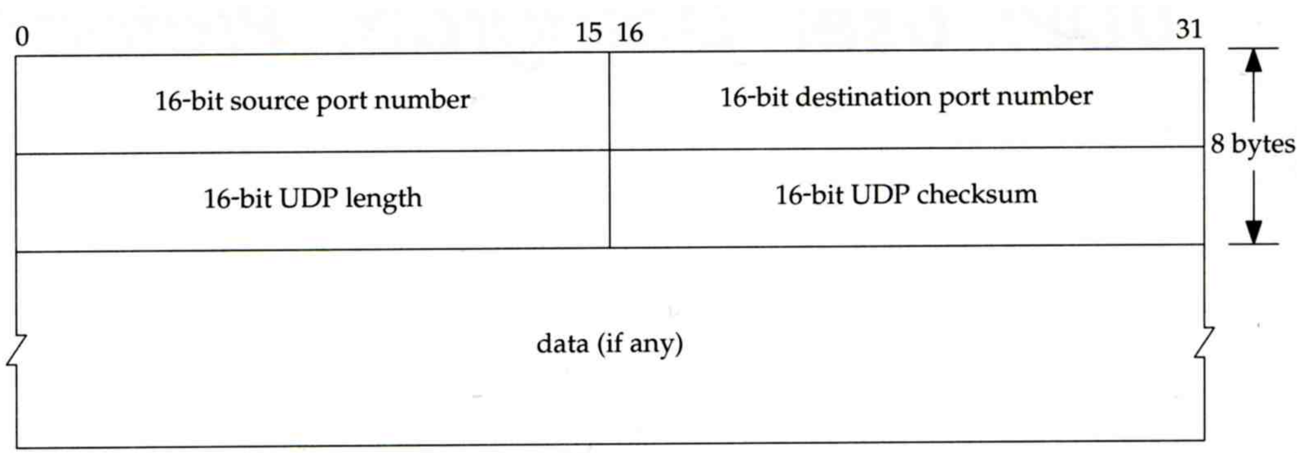
loopback



UDP –
User Datagram Protocol

UDP

- No reliability
  - Datagram-oriented, not stream-oriented protocol
- UDP header
  - 8 bytes
    - Source port and destination port
      - Identify sending and receiving process
    - UDP length: ≧ 8



UDP

- Application
  - VoIP
  - VPN (OpenVPN over UDP)
  - DNS
  - SNMP
  - Quick UDP Internet Connections (QUIC)
    - Designed by Google, based on UDP
    - Renamed to "HTTP/3"
    - Keep reliability as TCP, but less latency
      - As most HTTP connections will demand TLS, QUIC makes the exchange of setup keys and supported protocols part of the initial handshake process.
      - During network-switch events, reuse old connection instead of creating a new one as TCP does.

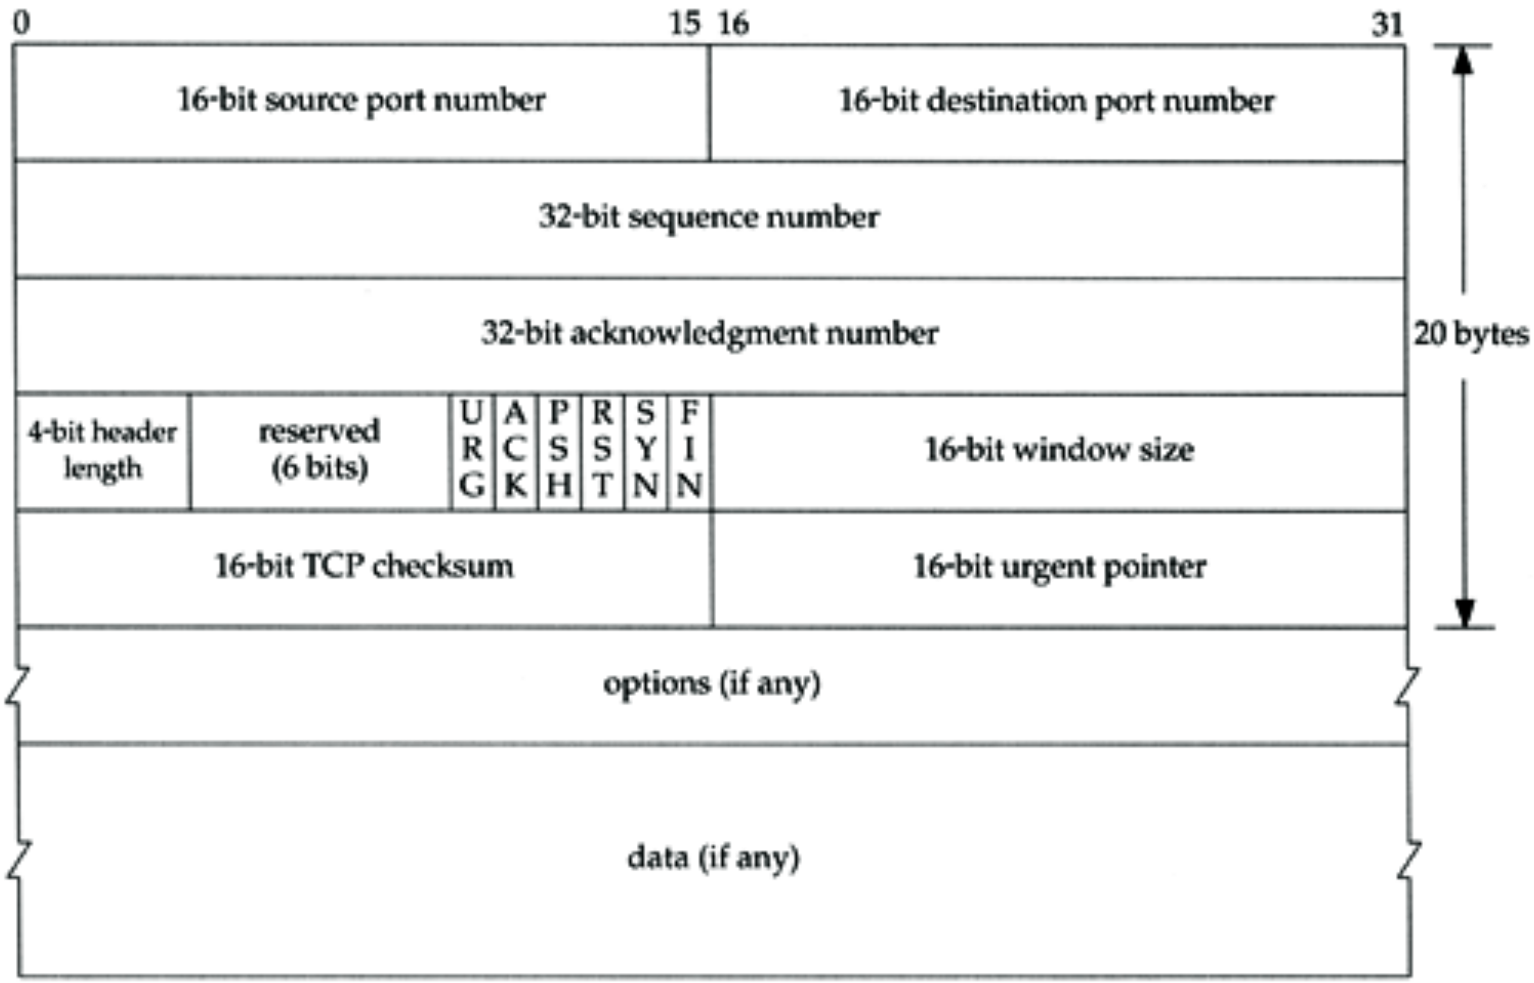
TCP –

Transmission Control Protocol

TCP

- Services
  - Connection-oriented
    - Establish TCP connection before exchanging data
  - Reliability
    - Acknowledgement when receiving data
    - Retransmission when timeout
    - Ordering
    - Discard duplicated data
    - Flow control

TCP
– Header (1)



0
15 16
31
16-bit source port number
16-bit destination port number
32-bit sequence number
32-bit acknowledgment number
4-bit header length
reserved (6 bits)
URG
ACK
PSH
RST
SYN
FIN
16-bit window size
16-bit TCP checksum
16-bit urgent pointer
options (if any)
data (if any)
20 bytes

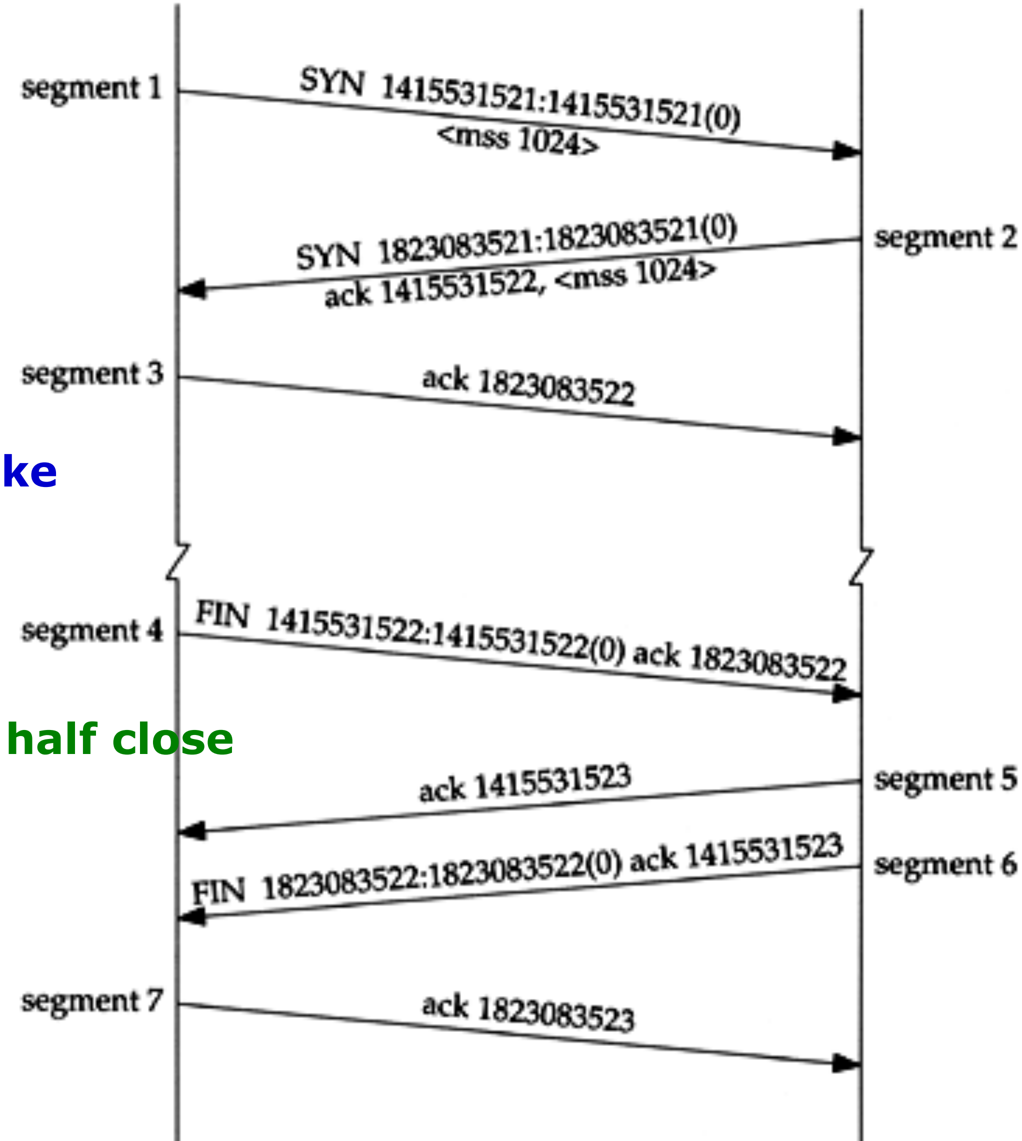
TCP
– Header (2)

- Flags
  - SYN
    - Establish new connection
  - ACK
    - Acknowledgement number is valid
    - Used to ack previous data that host has received
  - RST
    - Reset connection
  - FIN
    - The sender is finished sending data

TCP connection establishment and termination

Three-way handshake

TCP's half close

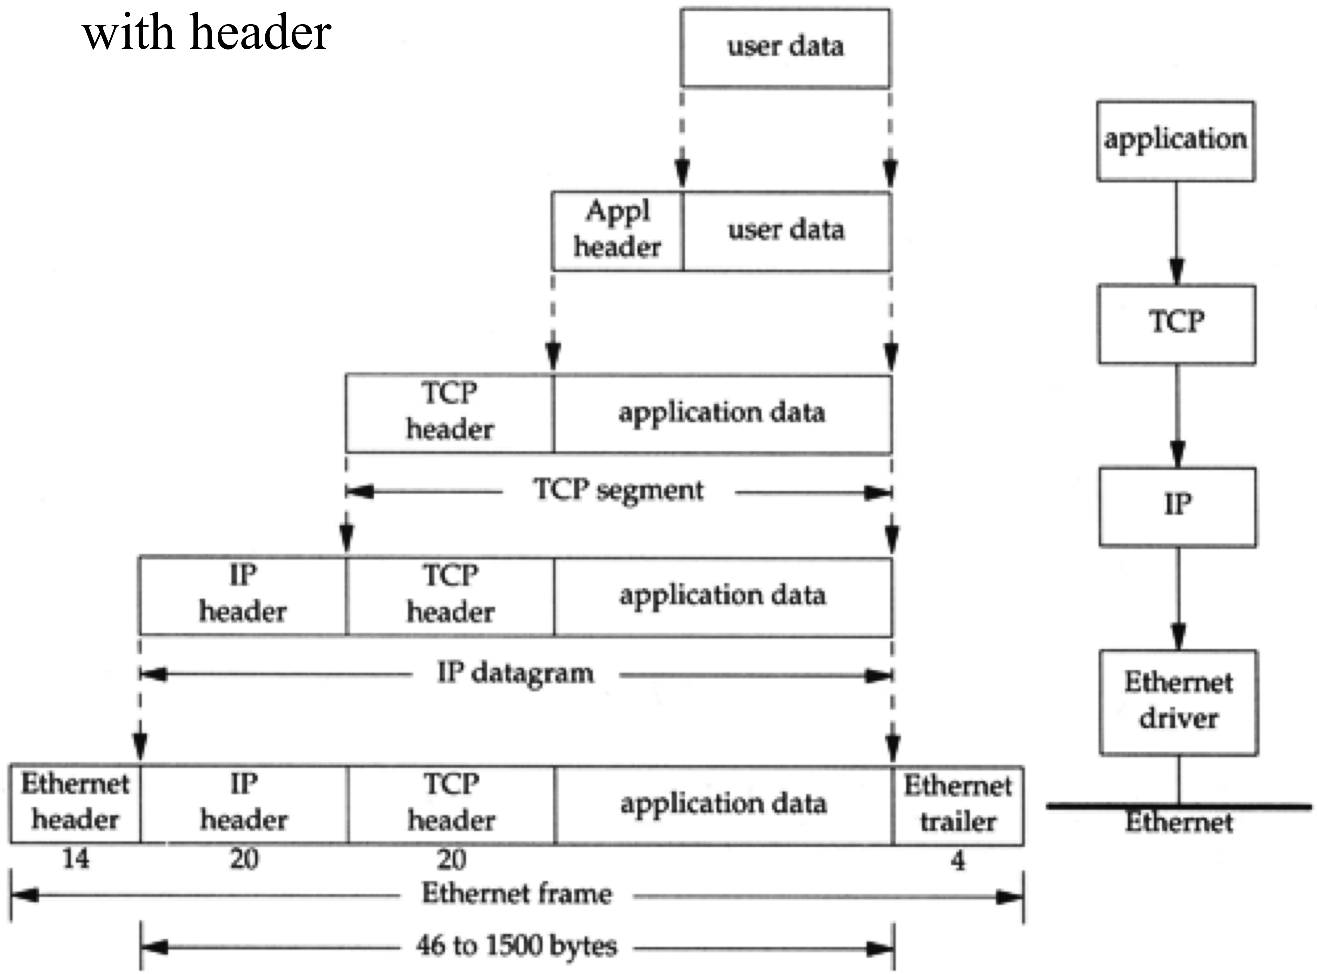


Appendix

Introduction
– Encapsulation

❑ Multiplexing

- Gathering data from multiple sockets, enveloping data with header



Introduction
– Decapsulation

- Demultiplexing
  - Delivering received segments to correct socket

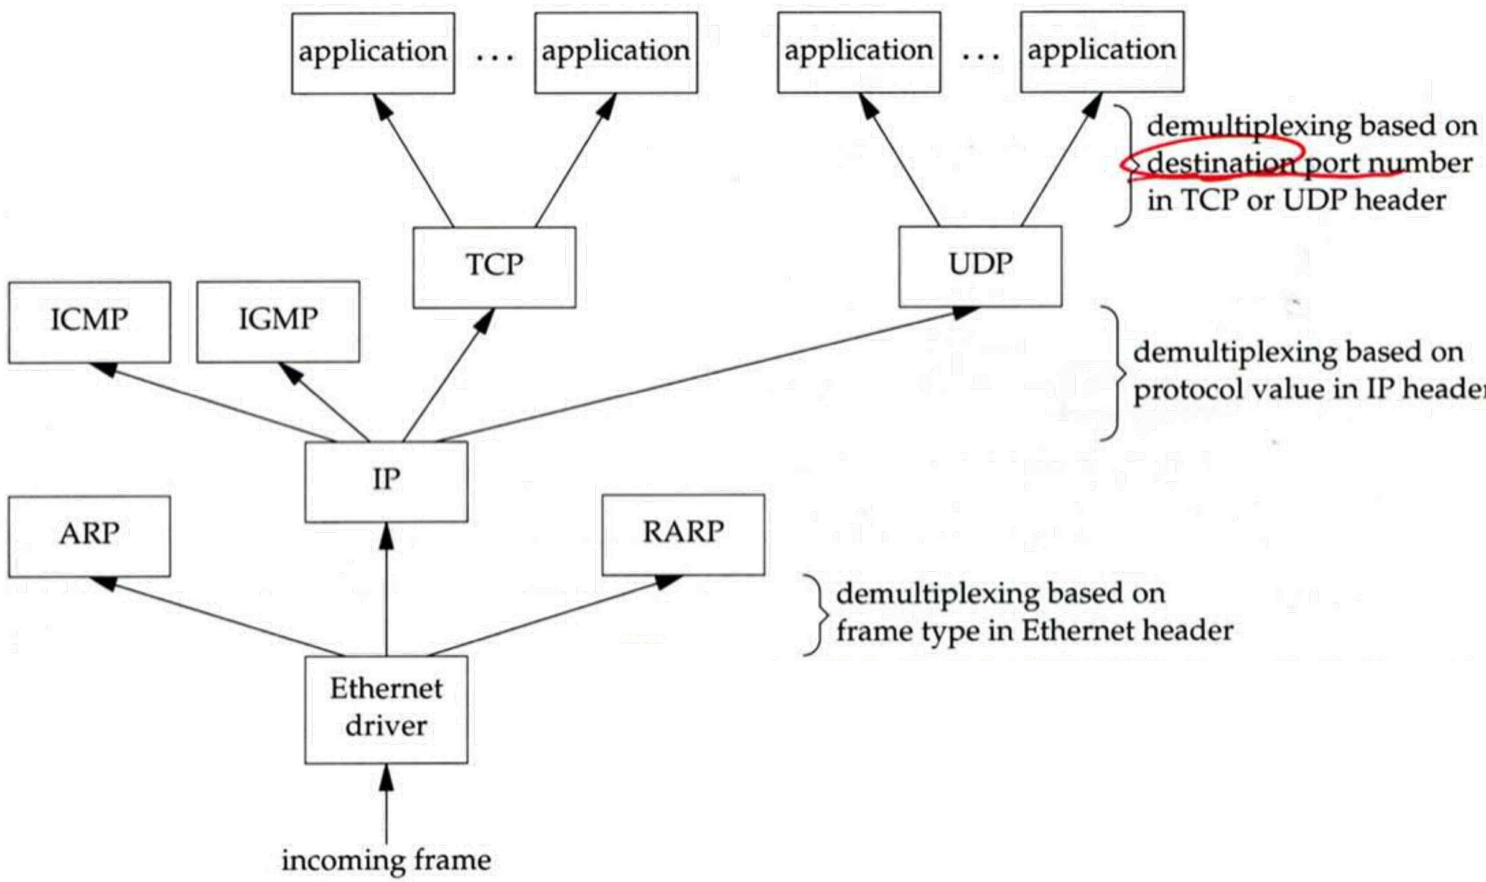


Figure 1.8 The demultiplexing of a received Ethernet frame.

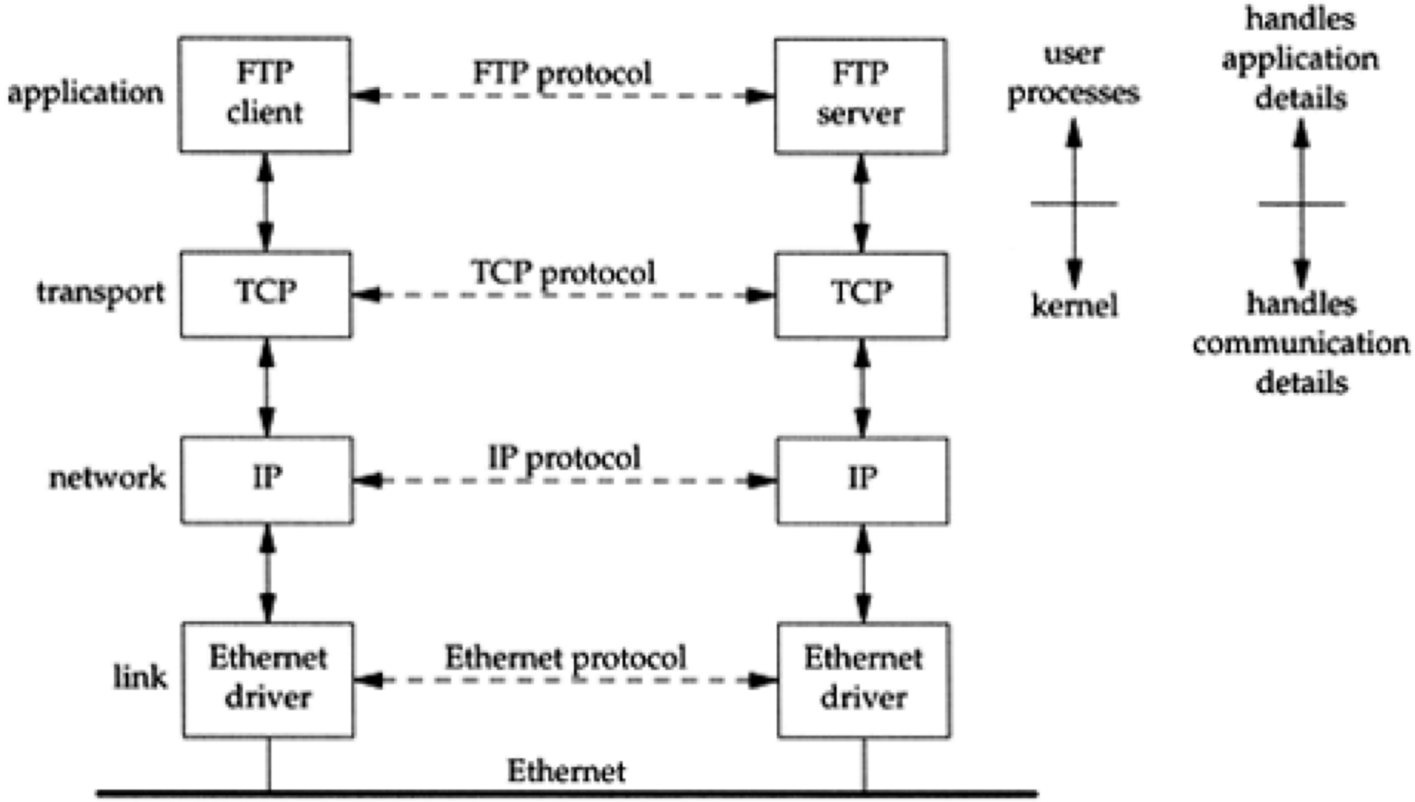
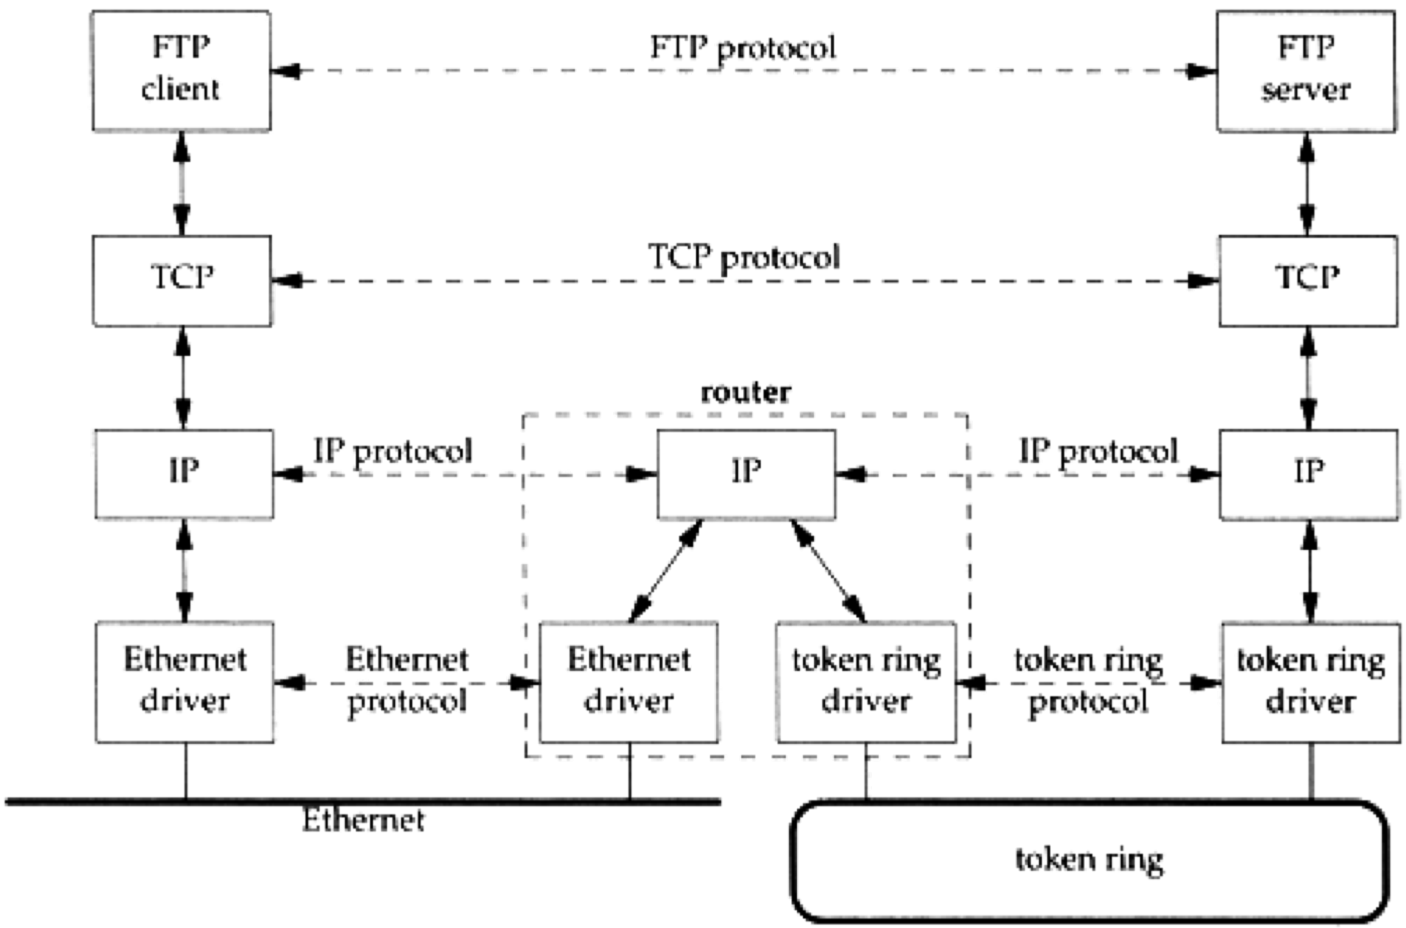
Introduction – Addressing

- Addressing
  - Nearby (same network)



Introduction
– Addressing

- Addressing
  - Faraway (across network)



Link Layer – MTU

- Maximum Transmission Unit
  - Limit size of payload part of Ethernet frame
    - 1500 bytes
  - If the IP datagram is larger than MTU,
    - IP performs "fragmentation"
- MTU of various physical device
- Path MTU
  - Smallest MTU of any data link MTU between the two hosts
  - Depend on route

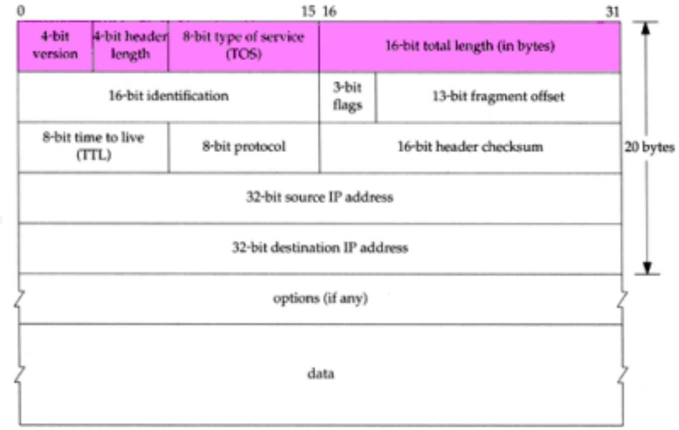
Network	MTU (bytes)
Hyperchannel	65535
16 Mbits/sec token ring (IBM)	17914
4 Mbits/sec token ring (IEEE 802.5)	4464
FDDI	4352
Ethernet	1500
IEEE 802.3/802.2	1492
X.25	576
Point-to-point (low delay)	296

Link Layer
– MTU

- To get MTU info

```
% ifconfig
em0: flags=8843<UP,BROADCAST,RUNNING,SIMPLEX,MULTICAST> mtu 9000
        options=b<RXCSUM,TXCSUM,VLAN_MTU>
        inet 192.168.7.1 netmask 0xffffff00 broadcast 192.168.7.255
        ether 00:0e:0c:01:d7:c8
        media: Ethernet autoselect (1000baseTX <full-duplex>)
        status: active
fxp0: flags=8843<UP,BROADCAST,RUNNING,SIMPLEX,MULTICAST> mtu 1500
        options=b<RXCSUM,TXCSUM,VLAN_MTU>
        inet 140.113.17.24 netmask 0xffffff00 broadcast 140.113.17.255
        ether 00:02:b3:99:3e:71
        media: Ethernet autoselect (100baseTX <full-duplex>)
        status: active
```

Network Layer – IP Header (1)



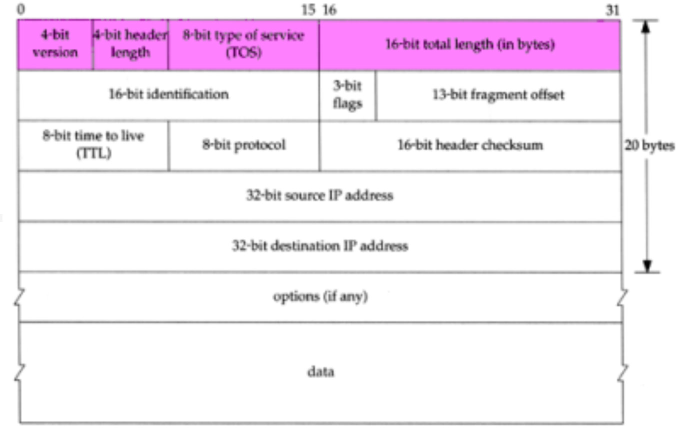
- Version (4-bit)
  - 4 for IPv4 and 6 for IPv6
- Header length (4-bit)
  - The number of 32-bit words in the header (15*4=60 bytes)
  - Normally, the value is 5 (no option)
- TOS - Type of Service (8-bit)
  - IP Precedence: 3-bit precedence + 4-bit TOS + 1-bit unused
  - DSCP: 3-bit major class + 3-bit drop preference + 2-bit ECN
- Total length (16-bit)
  - Total length of the IP datagram in bytes

DSCP: Differentiated Services Code Point
ECN: Explicit Congestion Notification

Name	Binary Value
Routine	000
Priority	001
Immediate	010
Flash	011
Flash Override	100
Critic/Critical	101
Internetwork Control	110
Network Control	111

Application	Minimize delay	Maximize throughput	Maximize reliability	Minimize monetary cost	Hex value
Telnet/Rlogin	1	0	0	0	0x10
FTP					
control	1	0	0	0	0x10
data	0	1	0	0	0x08
any bulk data	0	1	0	0	0x08
TFTP	1	0	0	0	0x10
SMTP					
command phase	1	0	0	0	0x10
data phase	0	1	0	0	0x08

Network Layer – IP Header (2)



- DSCP - Differentiated Services Code Point (6-bit)
  - Supersede the ToS field in IPv4 to make per-hop behavior (PHB) decisions
    - Default
      - Best-effort traffic
    - Expedited Forwarding (EF)
      - Dedicated to low-loss, low-latency traffic
    - Class Selector
      - Backward compatibility with the IP Precedence field
    - Assured Forwarding (AF)
      - Give assurance of delivery under prescribed conditions

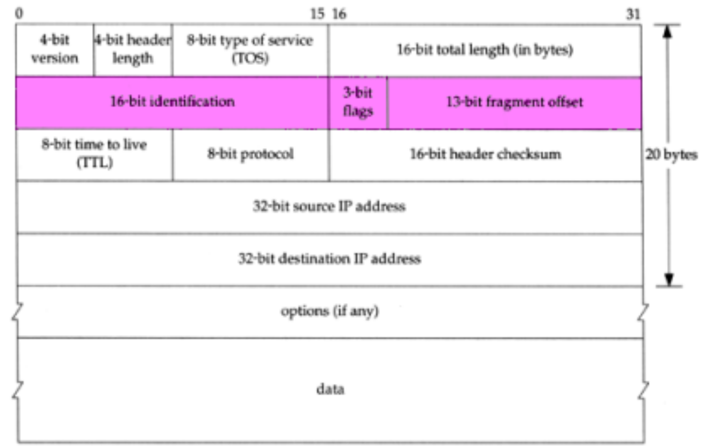
DSCP Class Selector Names	Binary DSCP Values	IPP Binary Values	IPP Names
Default/CS0*	000000	000	Routine
CS1	001000	001	Priority
CS2	010000	010	Immediate
CS3	011000	011	Flash
CS4	100000	100	Flash Override
CS5	101000	101	Critic/Critical
CS6	110000	110	Internetwork Control
CS7	111000	111	Network Control

Queue Class	Low Drop Probability	Medium Drop Probability	High Drop Probability
	Name/Decimal/Binary	Name/Decimal/Binary	Name/Decimal/Binary
1	AF11 / 10 / 001010	AF12 / 12 / 001100	AF13 / 14 / 001110
2	AF21 / 18 / 010010	AF22 / 20 / 010100	AF23 / 22 / 010110
4	AF31 / 26 / 011010	AF32 / 28 / 011100	AF33 / 30 / 011110
5	AF41 / 34 / 100010	AF42 / 36 / 100100	AF43 / 38 / 100110

- ECN: Explicit Congestion Notification (2-bit)
  - FreeBSD 8.0 implement ECN support for TCP
    - Enable ECN via sysctl(8)
      - net.inet.tcp.ecn.enable=1
  - Linux Kernel supports ECN for TCP since version 2.4.20

Binary Value	Description
00	Non ECN-Capable Transport, Non-ECT
10	ECN Capable Transport, ECT(0)
01	ECN Capable Transport, ECT(1)
11	Congestion Encountered, CE

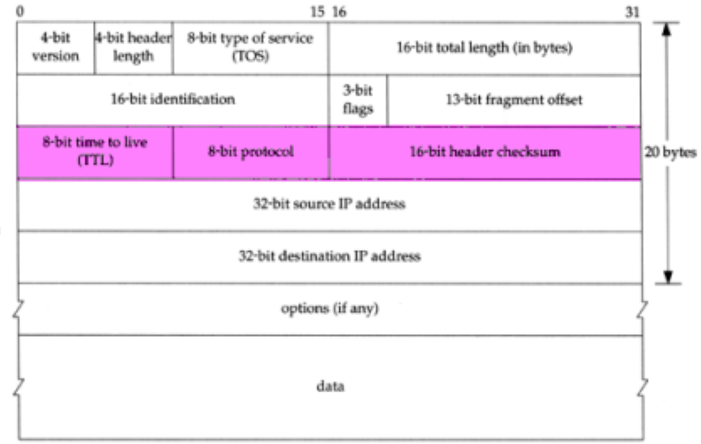
Network Layer – IP Header (3)



- ❑ Identification (16-bit)
  - Identify the group of fragments of a single IP datagram
- ❑ Fragmentation offset (13-bit)
  - Specify the offset of a particular fragment relative to the beginning of the original unfragmented IP datagram
- ❑ Flags (3-bit)
  - All these three fields are used for fragmentation

Reserved	Don't Fragment (DF)	More Fragments (MF)

Network Layer – IP Header (4)



- ❑ TTL (8-bit)
  - Limit of next hop count of routers
- ❑ Protocol (8-bit)
  - Used to demultiplex to other protocols
  - TCP, UDP, ICMP, IGMP
- ❑ Header checksum (16-bit)
  - Calculated over the IP header only
  - If checksum error, IP discards the datagram and no error message is generated

ICMP
– Message Type (1)

type	*code*	Description	Query	Error
0	0	echo reply (Ping reply, Chapter 7)	•	
3		destination unreachable:		
	0	network unreachable (Section 9.3)		•
	1	host unreachable (Section 9.3)		•
	2	protocol unreachable		•
	3	port unreachable (Section 6.5)		•
	4	fragmentation needed but don't-fragment bit set (Section 11.6)		•
	5	source route failed (Section 8.5)		•
	6	destination network unknown		•
	7	destination host unknown		•
	8	source host isolated (obsolete)		•
	9	destination network administratively prohibited		•
	10	destination host administratively prohibited		•
	11	network unreachable for TOS (Section 9.3)		•
	12	host unreachable for TOS (Section 9.3)		•
	13	communication administratively prohibited by filtering		•
	14	host precedence violation		•
	15	precedence cutoff in effect		•
4	0	source quench (elementary flow control, Section 11.11)		•

ICMP
– Message Type (2)

5		redirect (Section 9.5):		
	0	redirect for network		•
	1	redirect for host		•
	2	redirect for type-of-service and network		•
	3	redirect for type-of-service and host		•
8	0	echo request (Ping request, Chapter 7)	•	
9	0	router advertisement (Section 9.6)	•	
10	0	router solicitation (Section 9.6)	•	
11		time exceeded:		
	0	time-to-live equals 0 during transit (Traceroute, Chapter 8)		•
	1	time-to-live equals 0 during reassembly (Section 11.5)		•
12		parameter problem:		
	0	IP header bad (catchall error)		•
	1	required option missing		•
13	0	timestamp request (Section 6.4)	•	
14	0	timestamp reply (Section 6.4)	•	
15	0	information request (obsolete)	•	
16	0	information reply (obsolete)	•	
17	0	address mask request (Section 6.3)	•	
18	0	address mask reply (Section 6.3)	•	

ICMP – Query Message
– Address Mask Request/Reply (1)

- Address Mask Request and Reply
  - Used for diskless system to obtain its subnet mask
  - Identifier and sequence number
    - Can be set to anything for sender to match reply with request
  - The receiver will response an ICMP reply with the subnet mask of the receiving NIC

0	8	16	31
TYPE (17 or 18)	CODE (0)	CHECKSUM	
IDENTIFIER		SEQUENCE NUMBER	
ADDRESS MASK			

ICMP – Query Message
– Address Mask Request/Reply (2)

- Ex:

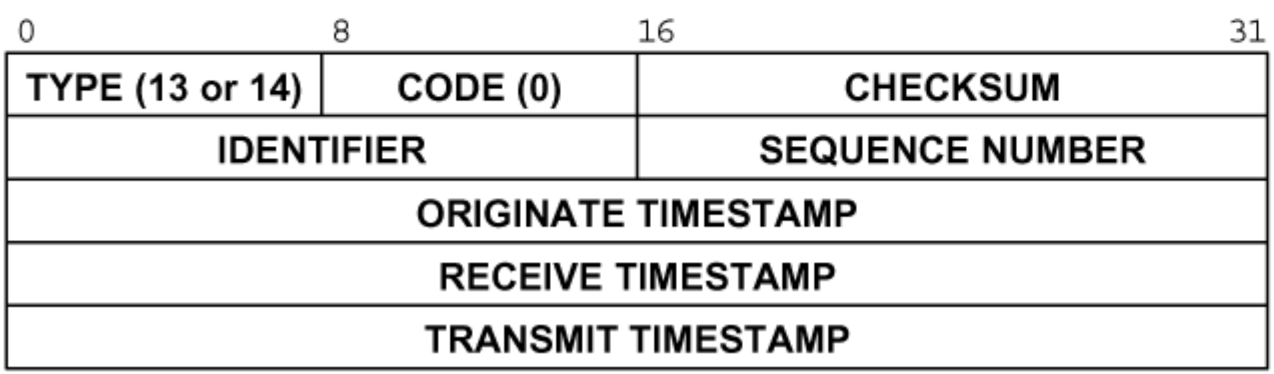
```
chbsd [/home/chwong] -chwong- ping -M m sun1.cs.nctu.edu.tw
ICMP_MASKREQ
PING sun1.cs.nctu.edu.tw (140.113.235.171): 56 data bytes
68 bytes from 140.113.235.171: icmp_seq=0 ttl=251 time=0.663 ms mask=255.255.255.0
68 bytes from 140.113.235.171: icmp_seq=1 ttl=251 time=1.018 ms mask=255.255.255.0
68 bytes from 140.113.235.171: icmp_seq=2 ttl=251 time=1.028 ms mask=255.255.255.0
68 bytes from 140.113.235.171: icmp_seq=3 ttl=251 time=1.026 ms mask=255.255.255.0
^C
--- sun1.cs.nctu.edu.tw ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.663/0.934/1.028/0.156 ms

chbsd [/home/chwong] -chwong- icmpquery -m sun1
sun1                              :  0xFFFFFF00
```

※ icmpquery can be found in /usr/ports/net-mgmt/icmpquery

ICMP – Query Message
– Timestamp Request/Reply (1)

- Timestamp request and reply
  - Allow a system to query another for the current time
  - Milliseconds resolution, since midnight UTC
  - Requestor
    - Fill in the originate timestamp and send
  - Reply system
    - Fill in the receive timestamp when it receives the request and the transmit time when it sends the reply



ICMP – Query Message – Timestamp Request/Reply (2)

- Ex:

```
chbsd [/home/chwong] -chwong- ping -M time nabsd
ICMP_TSTAMP
PING nabsd.cs.nctu.edu.tw (140.113.17.215): 56 data bytes
76 bytes from 140.113.17.215: icmp_seq=0 ttl=64 time=0.663 ms
    tso=06:47:46 tsr=06:48:24 tst=06:48:24
76 bytes from 140.113.17.215: icmp_seq=1 ttl=64 time=1.016 ms

```

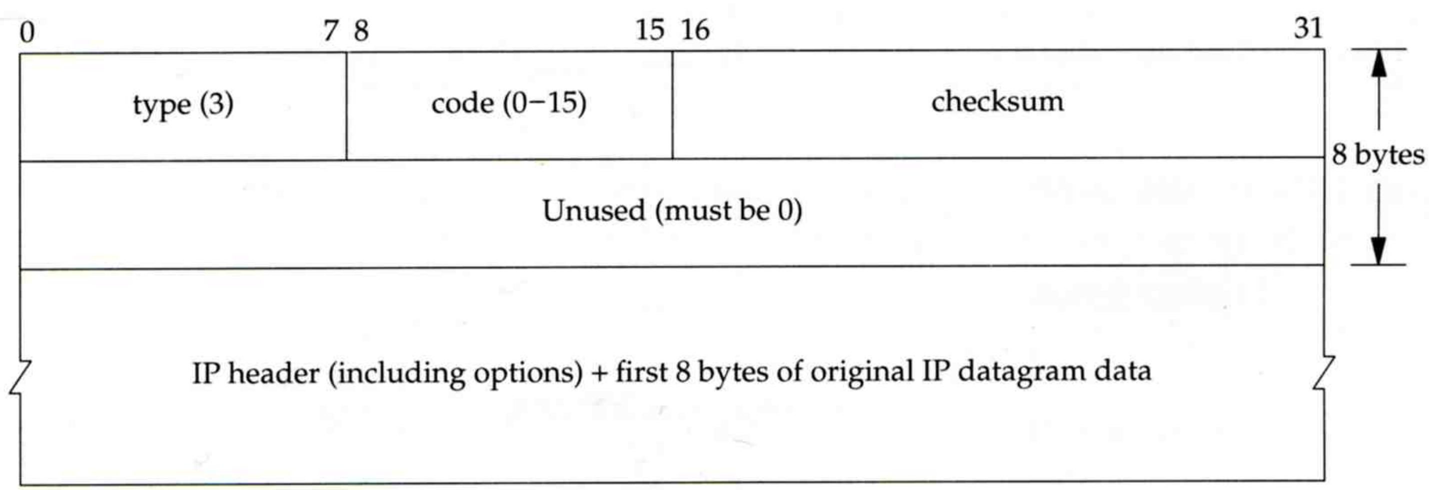
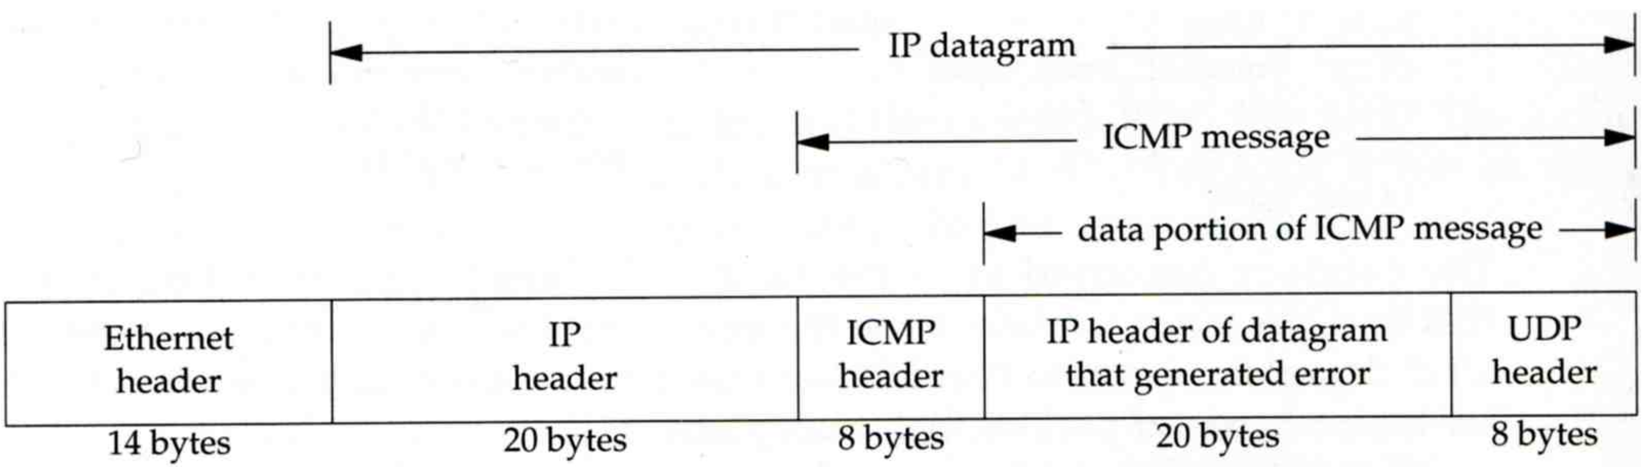
ICMP – Error Message
– Destination Unreachable Error Message

- Format
  - 8 bytes ICMP Header
  - Application-depend data portion
    - IP header
      - Let ICMP know how to interpret the 8 bytes that follow
    - first 8 bytes that followed this IP header
      - Information about who generates the error



ICMP – Error Message – Port Unreachable (1)

- ICMP port unreachable
  - Type = 3 , code = 3
  - Host receives a UDP datagram but the destination port does not correspond to a port that some process has in use



ICMP – Error Message – Port Unreachable (2)

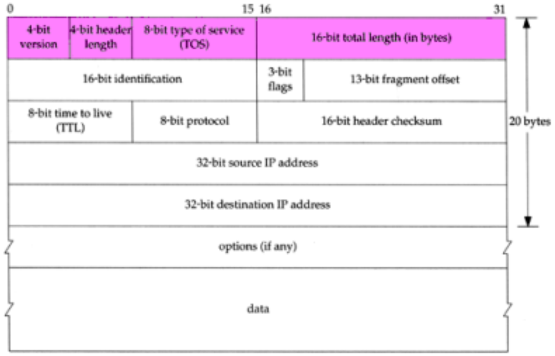
- Ex:
  - Using TFTP (Trivial File Transfer Protocol)
    - Original port: 69

```
chbsd [/home/chwong] -chwong- tftp
tftp> connect localhost 8888
tftp> get temp.foo
Transfer timed out.

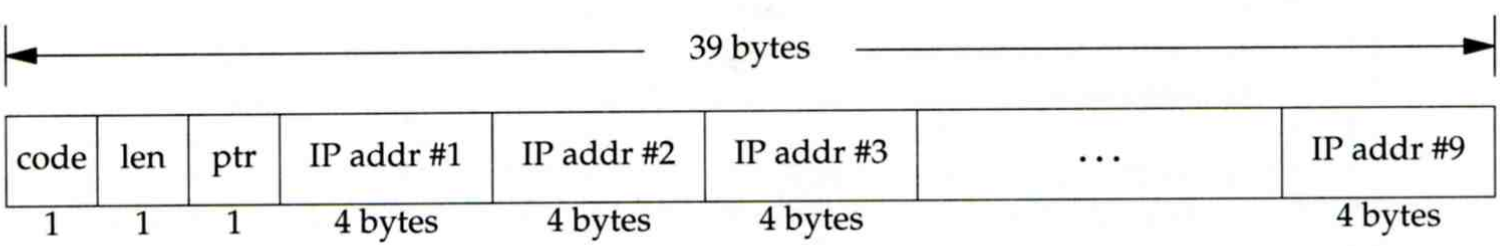
tftp>
```

```
chbsd [/home/chwong] -chwong- sudo tcpdump -i lo0
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on lo0, link-type NULL (BSD loopback), capture size 96 bytes
15:01:24.788511 IP localhost.62089 > localhost.8888: UDP, length 16
15:01:24.788554 IP localhost > localhost:
    ICMP localhost udp port 8888 unreachable, length 36
15:01:29.788626 IP localhost.62089 > localhost.8888: UDP, length 16
15:01:29.788691 IP localhost > localhost:
    ICMP localhost udp port 8888 unreachable, length 36
```

Traceroute Program – IP Source Routing Option (1)

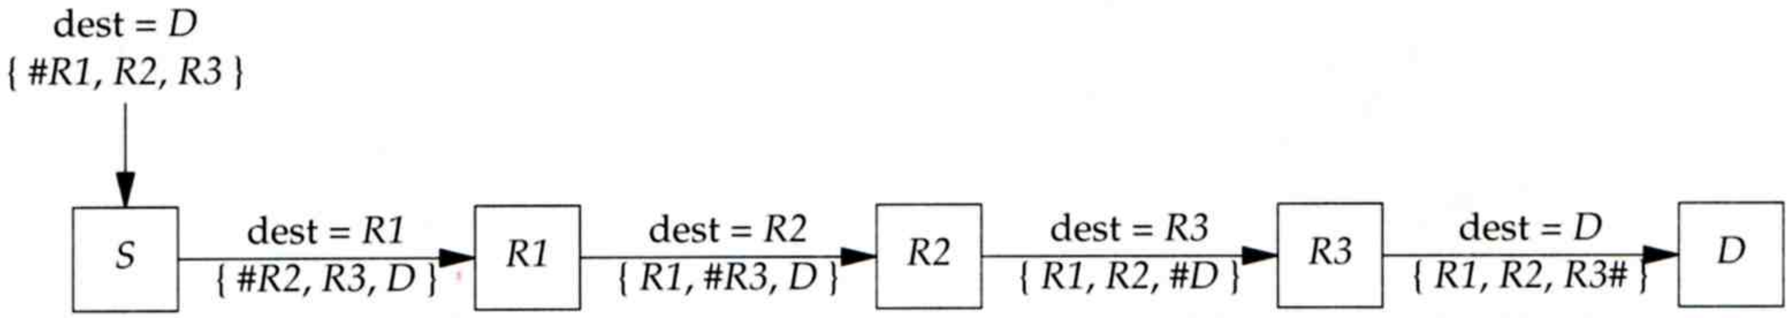


- ❑ Source Routing
  - Sender specifies the route
- ❑ Two forms of source routing
  - Strict source routing
    - ➢ Sender specifies the exact path that the IP datagram must follow
  - Loose source routing
    - ➢ As strict source routing, but the datagram can pass through other routers between any two addresses in the list
- ❑ Format of IP header option field
  - Code = 0x89 for strict and code = 0x83 for loose SR option



Traceroute Program – IP Source Routing Option (2)

- Scenario of source routing
  - Sending host
    - Remove first entry and append destination address in the final entry of the list
  - Receiving router != destination
    - Loose source route, forward it as normal
  - Receiving router = destination
    - Next address in the list becomes the destination
    - Change source address
    - Increment the pointer



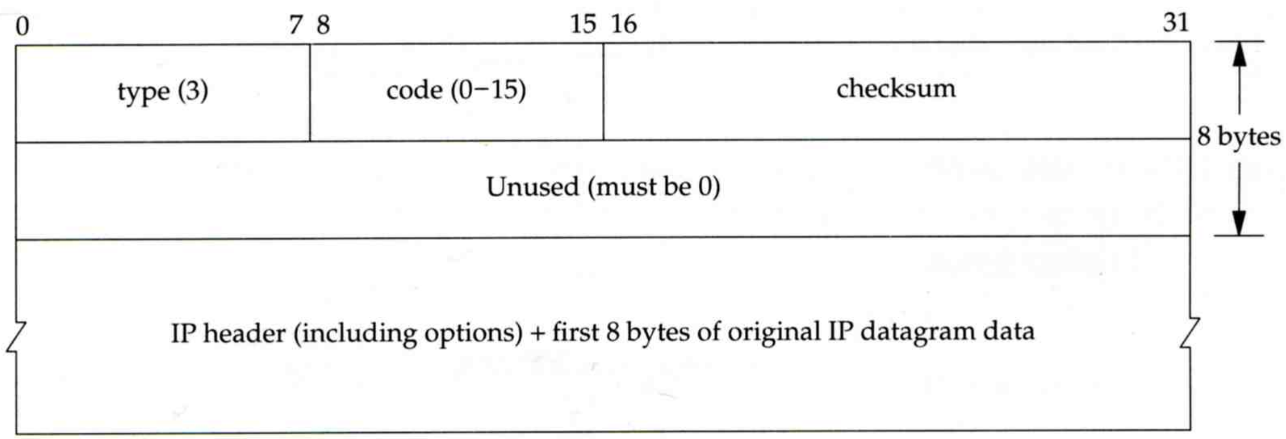
Traceroute Program – IP Source Routing Option (3)

- Traceroute using IP loose SR option
- Ex:

```
nabsd [/home/chwong] -chwong- traceroute u2.nctu.edu.tw
traceroute to u2.nctu.edu.tw (211.76.240.193), 64 hops max, 40 byte packets
 1  e3rtn-235 (140.113.235.254)  0.549 ms  0.434 ms  0.337 ms
 2  140.113.0.166 (140.113.0.166)  108.726 ms  4.469 ms  0.362 ms
 3  v255-194.NTCU.net (211.76.255.194)  0.529 ms  3.446 ms  5.464 ms
 4  v255-229.NTCU.net (211.76.255.229)  1.406 ms  2.017 ms  0.560 ms
 5  h240-193.NTCU.net (211.76.240.193)  0.520 ms  0.456 ms  0.315 ms
nabsd [/home/chwong] -chwong-  traceroute -g 140.113.0.149 u2.nctu.edu.tw
traceroute to u2.nctu.edu.tw (211.76.240.193), 64 hops max, 48 byte packets
 1  e3rtn-235 (140.113.235.254)  0.543 ms  0.392 ms  0.365 ms
 2  140.113.0.166 (140.113.0.166)  0.562 ms  9.506 ms  0.624 ms
 3  140.113.0.149 (140.113.0.149)  7.002 ms  1.047 ms  1.107 ms
 4  140.113.0.150 (140.113.0.150)  1.497 ms  6.653 ms  1.595 ms
 5  v255-194.NTCU.net (211.76.255.194)  1.639 ms  7.214 ms  1.586 ms
 6  v255-229.NTCU.net (211.76.255.229)  1.831 ms  9.244 ms  1.877 ms
 7  h240-193.NTCU.net (211.76.240.193)  1.440 ms !S  2.249 ms !S  1.737 ms !S
```

ICMP – No Route to Destination

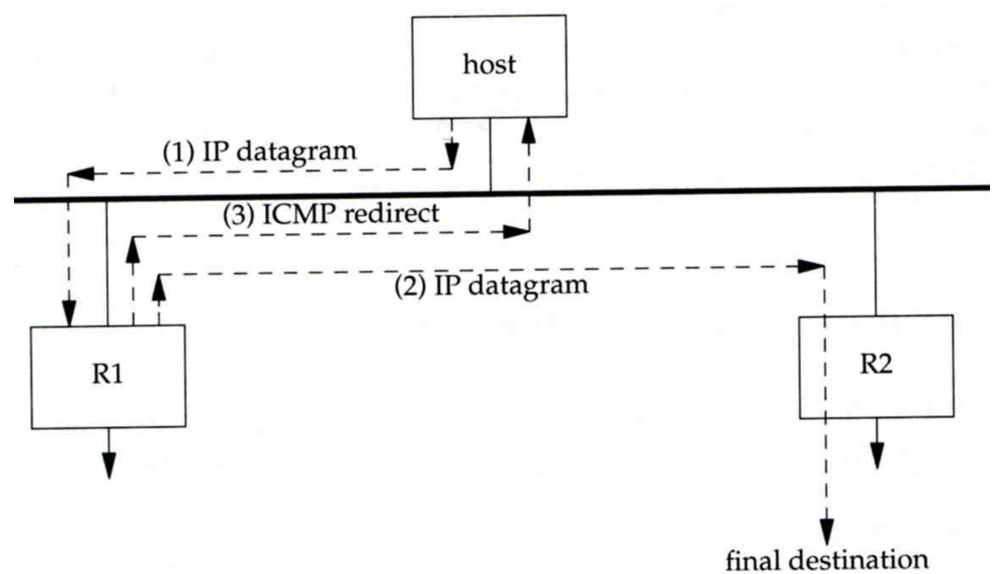
- If there is no match in routing table
  - If the IP datagram is generated on the host
    - "host unreachable" or "network unreachable"
  - If the IP datagram is being forwarded
    - ICMP "host unreachable" error message is generated and sends back to sending host
    - ICMP message
      - Type = 3, code = 0 for host unreachable
      - Type = 3, code = 1 for network unreachable



ICMP
– Redirect Error Message (1)

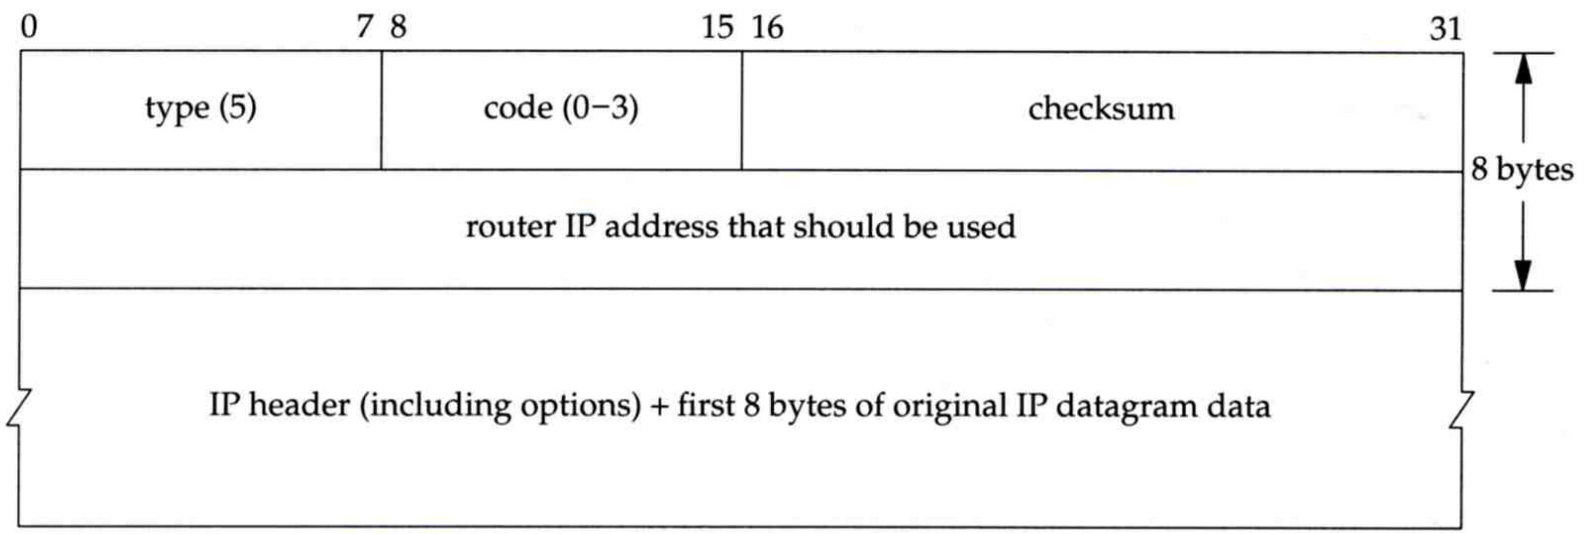
❑ Concept

- Used by router to inform the sender that the datagram should be sent to a different router
- This will happen if the host has a choice of routers to send the packet to
  - Ex:
    - R1 found sending and receiving interface are the same



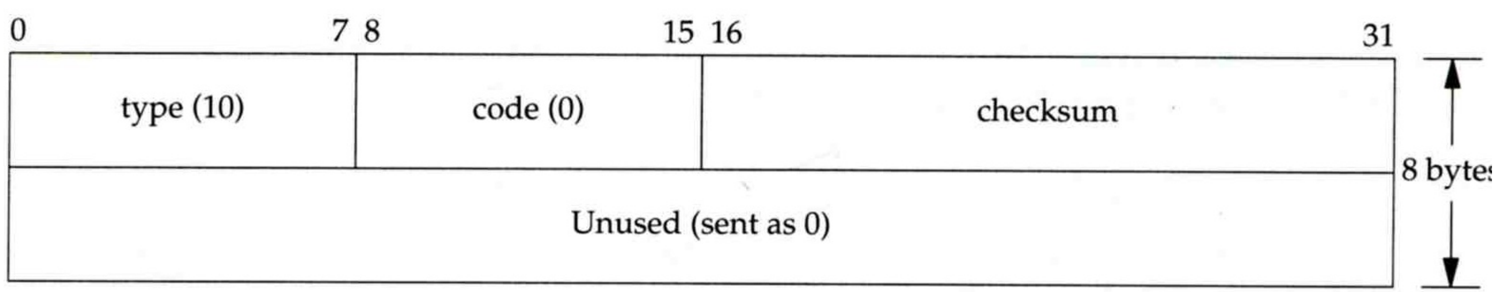
ICMP – Redirect Error Message (2)

- ICMP redirect message format
  - Code 0: redirect for network
  - Code 1: redirect for host
  - Code 2: redirect for TOS and network (RFC 1349)
  - Code 3: redirect for TOS and hosts (RFC 1349)



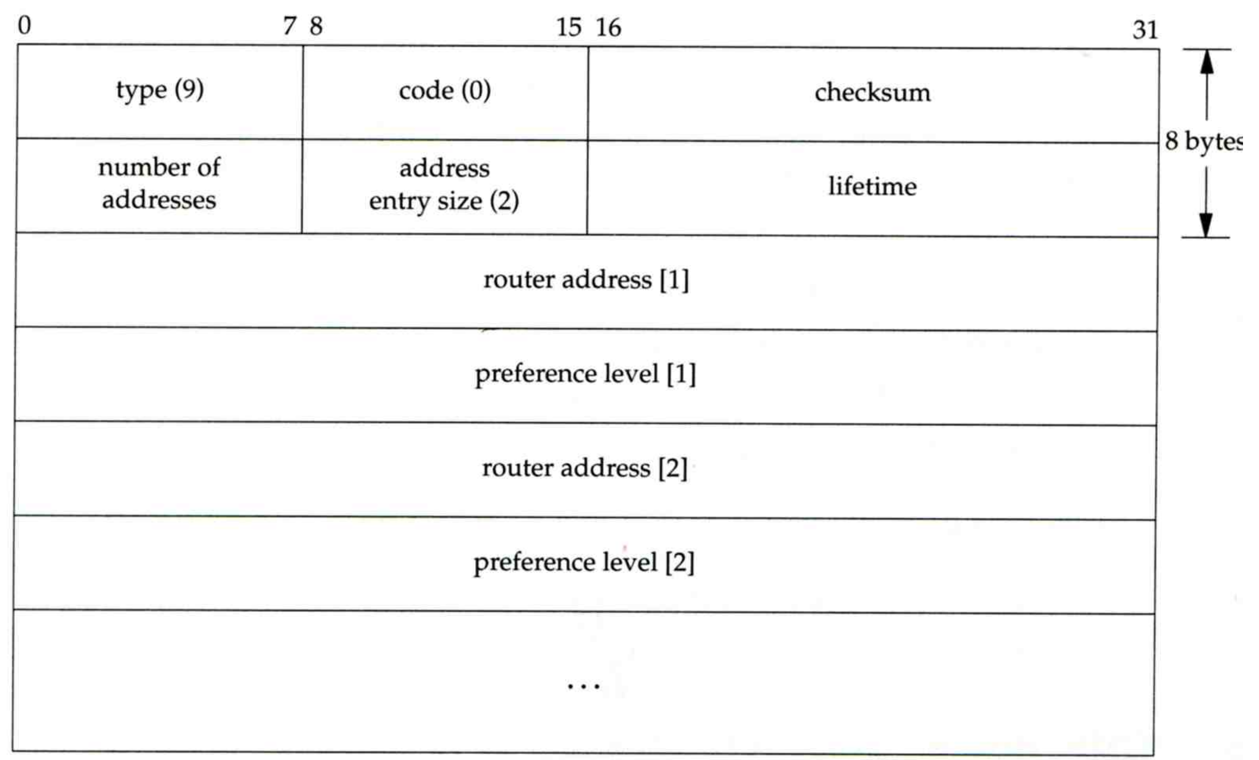
ICMP
– Router Discovery Messages (1)

- Dynamic update host's routing table
  - ICMP router solicitation message (懇求)
    - Host broadcast or multicast after bootstrapping
  - ICMP router advertisement message
    - Router response
    - Router periodically broadcast or multicast
- Format of ICMP router solicitation message



ICMP – Router Discovery Messages (2)

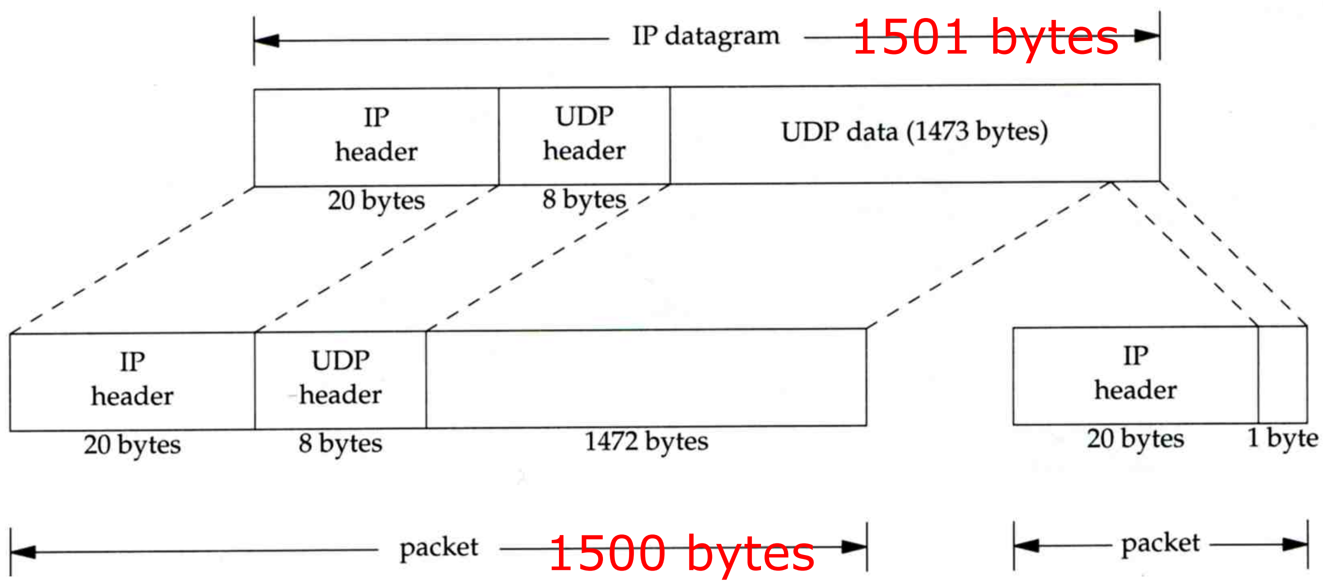
- Format of ICMP router advertisement message
  - Router address
    - Must be one of the router's IP address
  - Preference level
    - Preference as a default router address



IP Fragmentation (1)

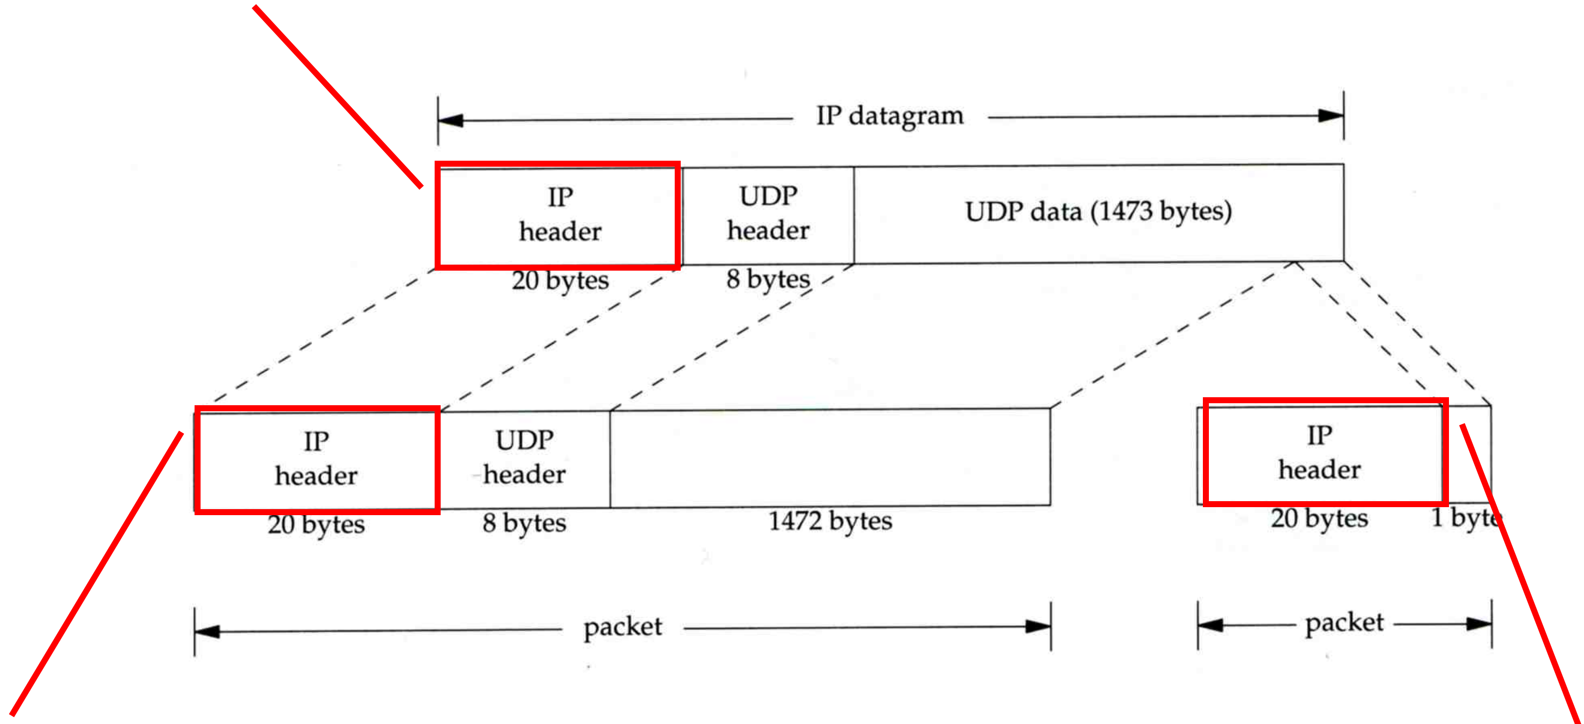
❑ MTU limitation

- Before network-layer to link-layer
  - ➢ IP will check the size and link-layer MTU
  - ➢ Do fragmentation if necessary
- Fragmentation may be done at sending host or routers
- Reassembly is done only in receiving host



IP Fragmentation (2)

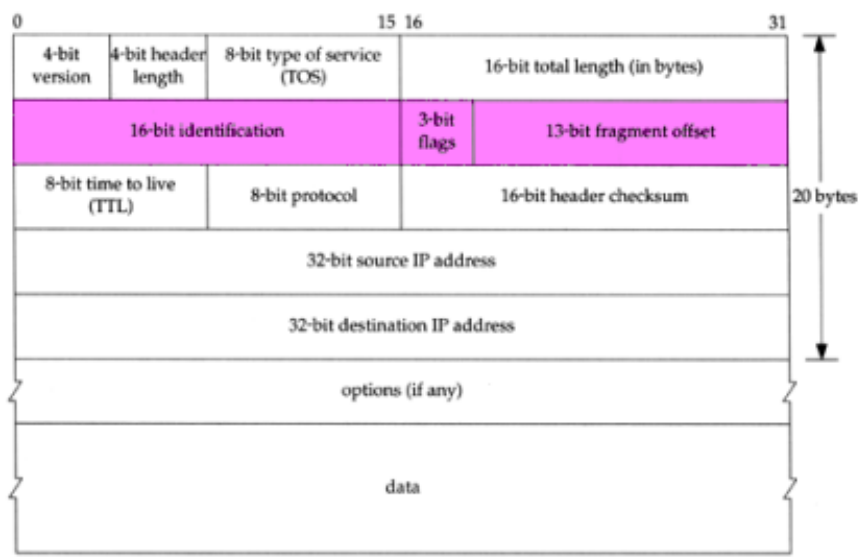
identification:	which unique IP datagram
flags:	more fragments?
fragment offset	offset of this datagram from the beginning of original datagram



identification:	the same		identification:	the same
flags:	more fragments		flags:	end of fragments
fragment offset	0		fragment offset	1480

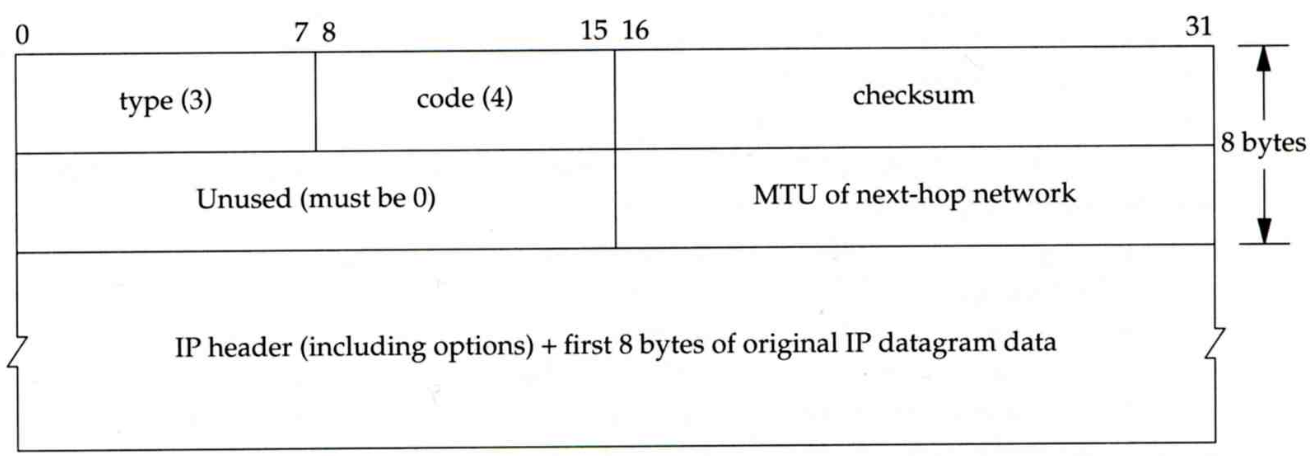
IP Fragmentation (3)

- Issues of fragmentation
  - One fragment lost, entire datagram must be retransmitted
  - If the fragmentation is performed by intermediate router, there is no way for sending host how fragmentation did
  - Fragmentation is often avoided
    - There is a "don't fragment" bit in flags of IP header



ICMP Unreachable Error – Fragmentation Required

- ❑ Type=3, code=4
  - Router will generate this error message if the datagram needs to be fragmented, but the “don’t fragment” bit is turn on in IP header
- ❑ Message format



ICMP – Source Quench Error

- Type=4, code=0
  - May be generated by system when it receives datagram at a rate that is too fast to be processed
  - Host receiving more than it can handle datagram
    - Send ICMP source quench or
    - Throw it away
  - Host receiving UDP source quench message
    - Ignore it or
    - Notify application
