Network Layer

The Network Layer

□ Path Determination

- The Internet Protocol (IP)
 - IP address (32 bits)

□ Topics

- IP Address
- Subnetting and netmask
- Address types
- Routing

The Network Layer

– IP Address

- 32-bit long
 - Network part
 - Identify a logical network
 - Host part
 - Identify a machine on certain network
- Ex:
 - NCTU
 - Class B address: 140.113.0.0
 - Network ID: 140.113
 - Number of hosts: $256 \times 256 = 65536$
- IP address category

Class	1 st byte ^a	Format	Comments
A	1-126	N.H.H.H	Very early networks, or reserved for DOD
B	128-191	N.N.H.H	Large sites, usually subnetted, were hard to get
C	192-223	N.N.N.H	Easy to get, often obtained in sets
D	224-239	–	Multicast addresses, not permanently assigned
E	240-254	–	Experimental addresses

a. The values 0 and 255 are special and are not used as the first byte of regular IP addresses. 127 is reserved for the loopback address.

The Network Layer

– Subnetting and Netmask (1)

□ Subnetting

- Borrow some bits from network ID to extends hosts ID
- Ex:
 - ClassB address : 140.113.0.0
= 256 ClassC-like IP addresses
in N.N.N.H subnetting method
 - 140.113.209.0 subnet

□ Netmask

- Specify how many bits of network-ID are used for network-ID
- Continuous 1 bits form the network part
- Ex:
 - 255.255.255.0 in NCTU-CS example
 - 256 hosts available
 - 255.255.255.248 in ADSL example
 - Only 8 hosts available

The Network Layer

– Subnetting and Netmask (2)

□ How to determine your network ID?

- Bitwise-AND IP and netmask
- Ex:
 - **140.113.214.37 & 255.255.255.0 ➔ 140.113.214.0**
 - **140.113.209.37 & 255.255.255.0 ➔ 140.113.209.0**
 - **140.113.214.37 & 255.255.0.0 ➔ 140.113.0.0**
 - **140.113.209.37 & 255.255.0.0 ➔ 140.113.0.0**
 - **211.23.188.78 & 255.255.255.248 ➔ 211.23.188.72**
 - **78 = 01001110**
 - **78 & 248= 01001110 & 11111000 =72**

The Network Layer

– Subnetting and Netmask (3)

□ In a subnet, not all IP are available

- The first one IP → network ID
- The last one IP → broadcast address
- Ex:

Netmask 255.255.255.0 140.113.209.32/24	Netmask 255.255.255.252 211.23.188.78/29
140.113.209.0 → network ID 140.113.209.255 → broadcast address 1 ~ 254, total 254 IPs are usable	211.23.188.72 → network ID 211.23.188.79 → broadcast address 73 ~ 78, total 6 IPs are usable

The Network Layer

– Subnetting and Netmask (4)

□ The smallest subnetting

- Network portion : 30 bits
 - Host portion : 2 bits
- 4 hosts, but only 2 IPs are available

□ ipcalc

- /usr/ports/net-mgmt/ipcalc

```
chbsd [/usr/ports/net-mgmt/ipcalc] -chwong- ipcalc 140.113.209.78/28

Netmask: 255.255.255.240 = 28  11111111.11111111.11111111.1111 0000
Wildcard: 0.0.0.15              00000000.00000000.00000000.0000 1111

HostMax: 140.113.209.78      10001100.01110001.11010001.0100 1110

The Network Layer

— IP address crisis

□ IP address crisis

- Run out of class B address
 - The most desirable ones for moderately large organizations
- IP address were being allocated on a FCFS
 - With no locality of reference

□ Solutions

- Short term
 - Subnetting and CIDR (classless inter-domain routing)
 - NAT (network address translation)
- Long term
 - IPv6

The Network Layer

– NAT (1)

□ Private Address

- Packets that bearing private address will not go out to the Internet
- 3 private addresses range
 - Depend on the size of your organization

IP class	From	To	CIDR range
Class A	10.0.0.0	10.255.255.255	10.0.0.0/8
Class B	172.16.0.0	172.31.255.255	172.16.0.0/12
Class C	192.168.0.0	192.168.255.255	192.168.0.0/16

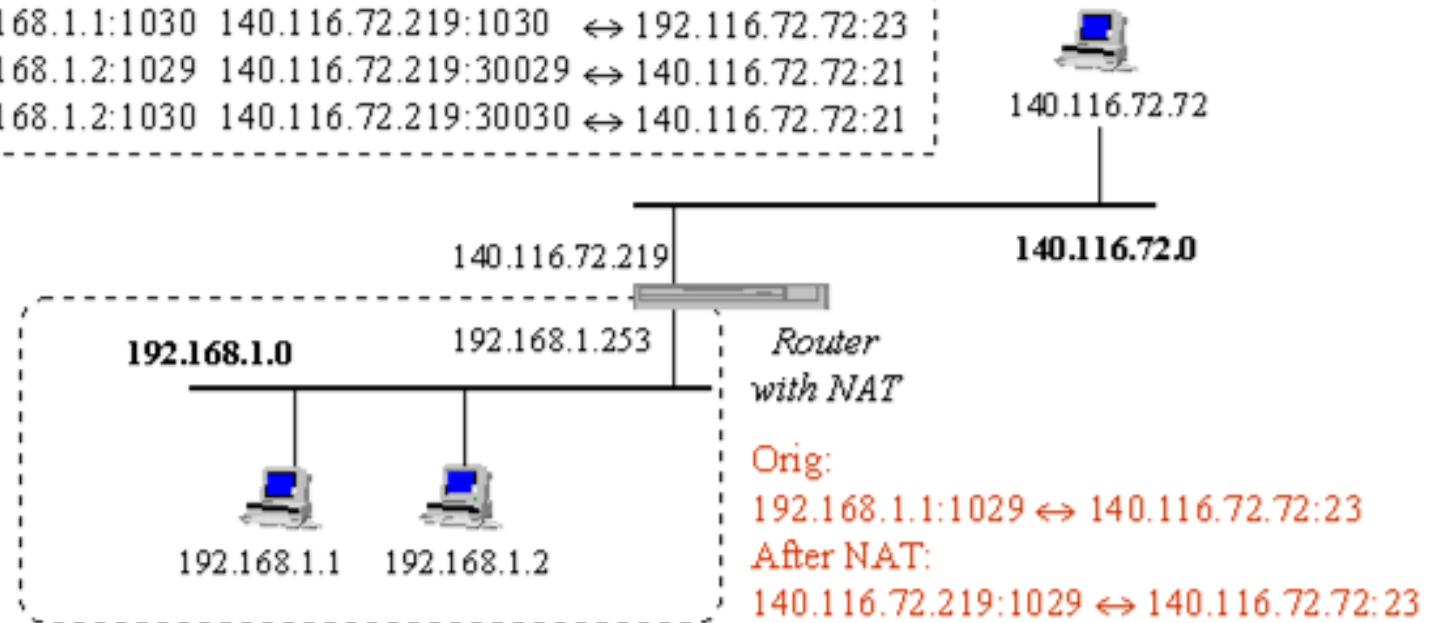

The Network Layer

– NAT (2)

- NAT
 - Network Address Translation
 - Allow hosts using private address to talk with outside

NAT mapping table

The Network Layer

– Routing (1)

- Goal: Direct a packet closer to the destination
- Flat v.s. Hierarchical
- Routing table
 - Routing information (which kind of packets to which way)
 - Rule-based information
 - Kernel will pick the most suitable way to route the packets

```

```
daytime    stream  tcp  nowait  root   internal
ftp        stream  tcp  nowait  root   /usr/libexec/ftpd      ftpd -l
ssh        stream  tcp  nowait  root   /usr/sbin/sshd      sshd -i -4

```

The Application Layer

– DNS

□ Domain Name System

- Record IP-hostname mapping
- DNS query
 - “what is the IP of vangogh.cs.berkeley.edu” from lair.cs.colorado.edu
- Hierarchical architecture

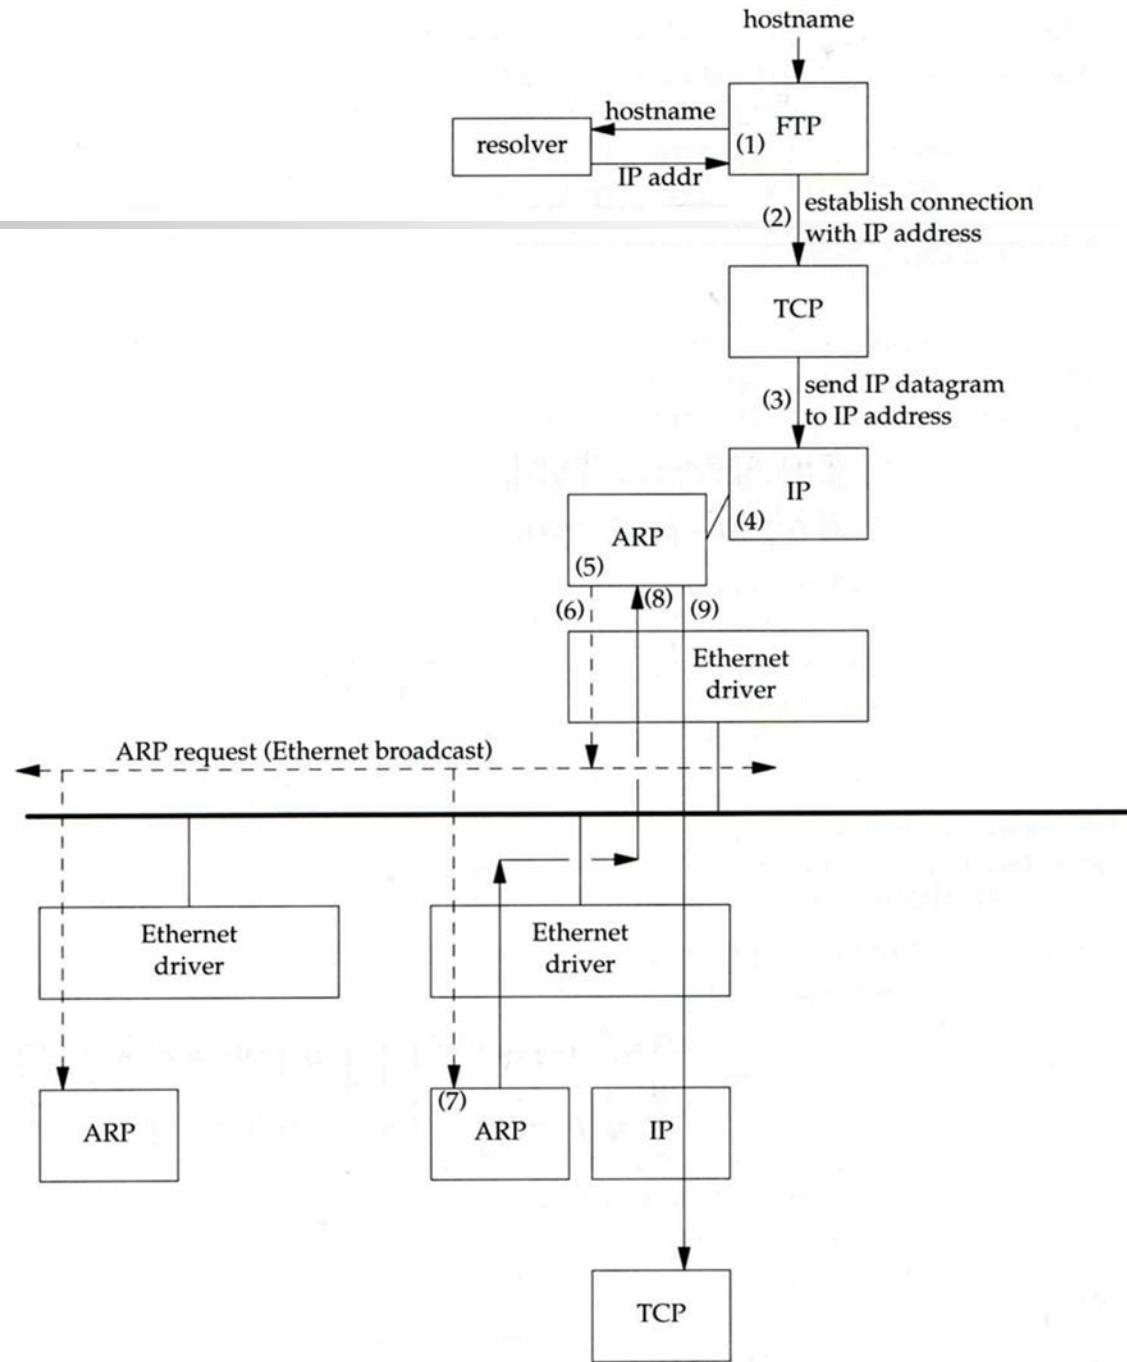

ARP (1)

□ Address Resolution Protocol

- Ask MAC address of certain IP
- Broadcast
- Any one receiving ARP packet and having this IP will reply to the sender
- When the host owing this IP is not on the same network, sender will use the MAC address of next-hop router to send the packet

ARP (2)

ARP (3)

❑ Maintain recent ARP results

- come from both ARP request and reply
- expiration time
 - Complete entry = 20 minutes
 - Incomplete entry = 3 minutes
- Use arp command to see the cache
- Ex:
 - % arp -a
 - % arp -da

```
[chwong@mg-215]~> arp -a
