

Services & Settings

lctseng

Basic Knowledge about Services

For FreeBSD

Common Flow of Running a Service

1. Installation

- Through ports, packages, or source tarballs
 - `pkg install kde4`

2. Configuration

- Service specific configuration file(s)
- Update `/etc/rc.conf`
 - `kdm4_enable="YES"`
- `service kdm4 enable`

3. Start

- `rc.d/*`
 - `/usr/local/etc/rc.d/kdm4 start`
- `service kdm4 start`

4. Maintenance

- Updating 、 Restarting

Configuration Files (1/3)

- ❑ Local installed programs' configuration files are located under `/usr/local/etc`
 - Daemon → *program-name.conf*
 - `pure-ftpd.conf`
 - user-program → *program-namerc*
 - `vimrc`
 - `screenrc`

- ❑ Default config file usually installed with `.sample` or `.default` suffix
 - `pure-ftpd.conf.sample`or different suffix for different purpose
 - `php.ini-dist`
 - `php.ini-recommended`copy and rename before use it

Configuration Files (2/3)

- ❑ A program with multiple config files are usually located in */usr/local/etc/program-name/*
 - apache*
 - postfix

- ❑ Most configuration files have clear comment at the beginning or before each description

- ❑ Most popular styles
 - *key <space>value*
 - *key = value*

```
# pure-ftpd.conf
```

```
# IP address/port to listen to (default=all IP and port 21)
```

```
Bind 127.0.0.1,21
```

```
# Fork in background
```

```
Daemonize yes
```

Read documents to know each option's meaning

Configuration Files (3/3)

❑ Some with local effectiveness (e.g. http server)

- Markup language-like

```
<directory /path>
    setting-for-this-path...
</directory>
```

- Samba 、 rsync 、 devfs...

```
[xxxx]
settings...
```

```
[yyyy]
settings....
```

```
<VirtualHost _default_:443>
ServerAdmin lctseng@cs.nctu.edu.tw
DocumentRoot "/usr/local/www/nic2015/"
ServerName nic2015.nctu.cs.tw:443
ErrorLog "/var/log/www.nic2015.error"
CustomLog "/var/log/www.nic2015.common" common
TransferLog "/var/log/www.nic2015.access"

<Directory "/usr/local/www/nic2015/">
    AllowOverride All
    Require all granted
</Directory>
<Directory "/usr/local/www/nic2015/wp-admin">
    Require ip 140.113
</Directory>
<If "%{REQUEST_URI} =~ /wp-login.php/i">
    Require ip 140.113
</If>
```

```
[system=10]
add path 'usb/*' mode 0660 group operator
```

RC Script

Scripts for starting / stopping a service

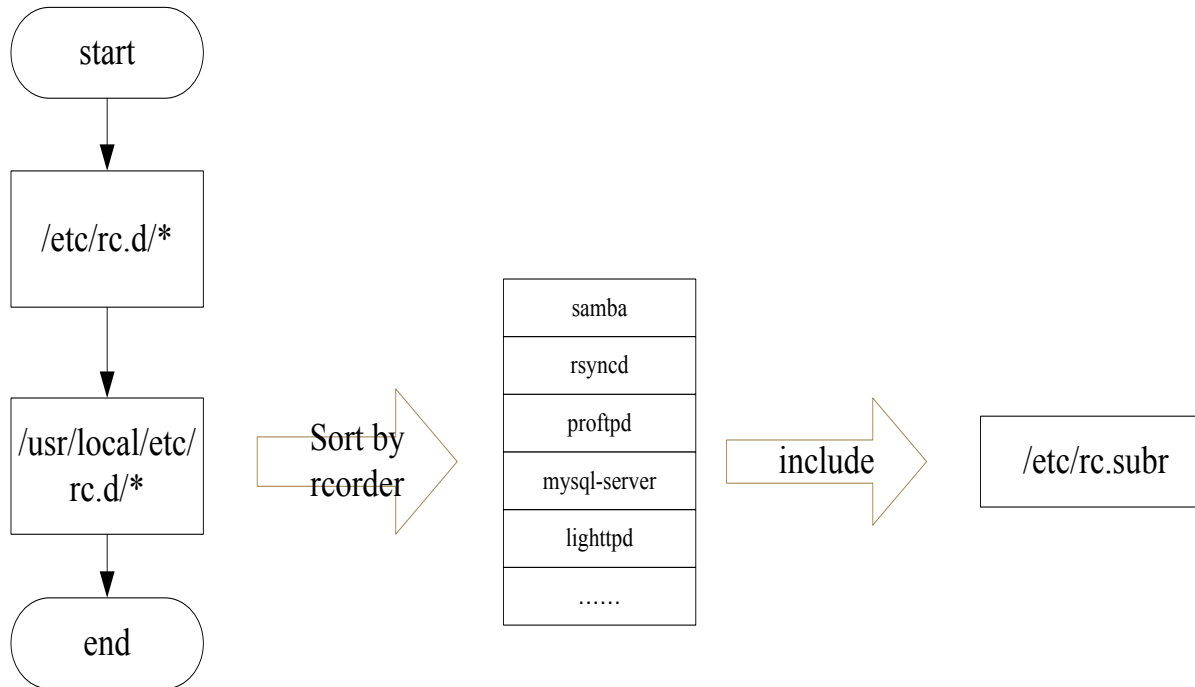

What does RC means?

- ❑ Run Commands (RunCom)
- ❑ Command scripts for auto-reboot and daemon startup
- ❑ rc(8)
- ❑ <https://www.freebsd.org/doc/handbook/configtuning-rcd.html>

Why do we need RC Script?

- ❑ Start services on system startup
- ❑ Starting and Stopping services in a standard way
 - Without rc
 - `/usr/local/sbin/pure-ftpd -g /var/run/pure-ftpd.pid -A -c50 -B -C8 -D -fftp -H -I15 -lpam -lunix -L10000:8 -m4 -s -U133:022 -u100 -k99 -Z`
 - V.S.**
 - With rc
 - `service pure-ftpd start`
 - Write configuration in the rc script for easy launch

RC Script

- ❑ Dependency between each service is described in header of the script
- ❑ `rcorder` is used to find out dependency ordering of each script
- ❑ Each rc script defines what to do when start / stop ...
- ❑ `/etc/rc.subr` defines what to do & check before / after start stop
- ❑ `rc.subr(8)`

Components to launch daemon processes

- ❑ To launch a daemon process in background, we need:
- ❑ Launch command
 - Path to the executable binary/script
 - `/usr/sbin/inetd`
- ❑ Path to configuration file
 - Program-specified configuration (ports to use, files to read/write, ...)
 - `/etc/inetd.conf`
- ❑ Pidfile
 - Records (master) process id of the service
 - Other process (like “service” tool) can know what PID to show/kill
 - `/var/run/inetd.pid`

Inside the RC Script

❑ Example: /etc/rc.d/inetd

```
#!/bin/sh
#
# $FreeBSD: release/9.1.0/etc/rc.d/inetd 231653 2012-02-14
#
```

```
# PROVIDE: inetd
# REQUIRE: DAEMON LOGIN cleanvar
# KEYWORD: shutdown
```

for rcorder(8) to sort.

```
. /etc/rc.subr
```

need to be included
by every RC script.

```
name="inetd"
rcvar="inetd_enable"
command="/usr/sbin/${name}"
pidfile="/var/run/${name}.pid"
required_files="/etc/${name}.conf"
extra_commands="reload"
```

what to do with
start/stop/....

```
load_rc_config $name
run_rc_command "$1"
```

How to use rc script (1)

❑ Example: ntpd

```
nctucs [~] -lctseng- /etc/rc.d/ntpd
Usage: /etc/rc.d/ntpd [fast|force|one|quiet](start|stop|restart|rcvar|enable|disable|delete|enable|describe|extra|command|fetch|need|fetch|status|poll
```

❑ After booting... (rc.conf)

```
nctucs [~] -lctseng- cat /var/db/ntp/ntpd.pid
4239
nctucs [~] -lctseng- ps aux | grep ntp
ntpd 4239  0.0  0.8 16488 16580 - Ss  08:45   0:00.02 /usr/sbin/ntpd -p
/var/db/ntp/ntpd.pid -c /etc/ntp.conf -f /var/db/
```

❑ An easy way to access: “service”

- \$ service ntpd start/stop/restart/reload/...
- Search /etc/rc.d and /usr/local/etc/rc.d

How to use rc script (2)

❑ Start

- Start the service and write PID files now

❑ Stop

- Terminates the service by killing the process with PID recorded in pidfile

❑ Restart

- Restart the service (or just start a new one if not running)
- Some services implement 'restart' by 'stop + start'

❑ Enable/Disable

- Edit /etc/rc.conf with XXX_enable="YES" or "NO"
- Will automatically launch when booting

How to use rc script (3)

❑ Status

- Check the service is running or not

❑ Reload

- Reload configuration file if the service support

❑ Rcvr

- Show the variables used in rc.conf

```
nctucs [~] -ltseng- service pure-ftp revar
# pureftpd
#
pureftpd_enable="no"
# (default: "")
```

How to use rc script (4)

❑ [one | fast | force]

- One
 - Skip the check of rcvar="YES"
 - Start the service even if XXXX_enable="NO"
- Force
 - Force start the service
 - Ignore any error it encountered (no prerequisite test)
 - ignore rcvar="YES" and set rc_force="YES"
- Fast
 - Skip the check for an existing running process (pid check)
 - Set rc_fast="YES"

Local installed service

- ❑ More about how to use rc.conf for an installed service, read comments from that script
 - /usr/local/etc/rc.d/pure-ftpd

```
# Add the following lines to /etc/rc.conf to enable pure-ftpd:
#
# pureftpd_enable="yes"
# pureftpd_flags="<set as needed>"
#
# Add the following lines to /etc/rc.conf to enable pure-authd daemon:
#
# pureftpd_authd_enable="yes"
# pureftpd_authdscript="/full/path/to/auth_script"
# pureftpd_authsocket="/var/run/ftpd.sock"
#
# Add the following lines to /etc/rc.conf to enable uploadscript daemon:
#
# pureftpd_upload_enable="yes"
# pureftpd_uploadscript="/full/path/to/upload_script"
```

System-V

Startup Scripts

❑ System V-style startup scripts

- Sun
- /etc/init.d/ ←
- /etc/rc.d/rcn.d/  Symbolic link
- Each script is responsible for one daemon or one aspect of system.

Example: sshd in SunOS

```
case "$1" in
'start')
    if [ -x /usr/local/sbin/sshd ]; then
        echo "Starting the secure shell daemon "
        /usr/local/sbin/sshd &
    fi
    ;;
'stop')
    echo "Stopping the secure shell daemon "
    pkill -TERM sshd
    ;;
*)
    echo "Usage: /etc/init.d/sshd { start | stop }"
    ;;
esac
exit 0
```

Startup Scripts – System V-style startup scripts (1)

❑ /etc/rc.d/rcn.d/

- When init transitions from lower run level to higher one,
 - it runs all the scripts that start with “S” in ascending order with “start” argument
- When init transitions from high run level to lower one,
 - it runs all the scripts that start with “K” in descending order with “stop” argument

```
[tytsai@linux5 /etc]$ cd rc.d
[tytsai@linux5 rc.d]$ ls
init.d  rc0.d  rc2.d  rc4.d  rc6.d      rc.sysinit
rc      rc1.d  rc3.d  rc5.d  rc.local
[tytsai@linux5 rc.d]$ cd rc2.d
[tytsai@linux5 rc2.d]$ ls
K03rhnisd      K24irda      K50xinetd    K86nfslock    S17keytable    S85gpm
K05atd         K28amd      K65identd    K87portmap    S20random      S90crond
K05saslauthd   K30spamassassin  K73ypbind    K95firstboot  S24pcmcia      S90xfs
K12clwmn       K34yppasswdd  K74nscd      K95kudzu      S26apmd        S95anacron
K12tlwmn       K35winbind   K74ntpd      S08iptables   S28autofs      S99local
K20nfs         K44rawdevices  K74ypserv    S09isdn       S55sshd        S99squid
K20rstatd     K50snmpd     K74ypxfrd    S10network    S60lpd
K20usersd     K50snmptrapd  K75netfs     S12syslog     S80sendmail
[tytsai@linux5 rc2.d]$
```

Startup Scripts – System V-style startup scripts (2)

- ❑ If you write a daemon and want init to start/stop it,
 - write a script and put in `/etc/init.d`
 - make suitable symbolic link in `rcn.d`
 - **`ln -s /etc/init.d/initiald /etc/rc2.d/S61initiald`**
 - **`ln -s /etc/init.d/initiald /etc/rc0.d/K33initiald`**

Systemd

Service management for modern Linux
distributions

Systemd

- ❑ Evolved from System-V
 - Backward compability
- ❑ Goal: provide a faster booting process
 - Less processes
 - Parallel launching
- ❑ Use ‘targets’ replace run-levels
 - Easier to use
- ❑ Tool
 - systemctl (1)
 - Similar to ‘service’ tool in FreeBSD

Flow of Running a Service with Systemd

Example with Ubuntu 18.04

1. Installation
 - Through packages, or source tarballs
 - `apt install apache2`
2. Configuration
 - Service specific configuration file(s)
 - `/etc/apache2/*`
 - `systemctl enable apache2`
3. Start
 - `systemctl start apache2`
4. Maintenance
 - Updating 、 Restarting

How to use systemctl

❑ Usage

- `systemctl [OPTIONS...] {COMMAND} ...`

❑ Common commands

- `enable / disable`
 - Enable/disable launch when booting
- `start / stop / reload / restart / status`
- `condrestart`
 - Restart only if service is running

Unit files

❑ Define services

- /lib/systemd/system/*
- Similar to /etc/rc.d/* in FreeBSD

❑ systemd.service (5)

❑ Example 1: (simple service)

- Type
 - Simple: main process keeps running
 - Forking: main process forks and exits
- ExecStart
 - Command to launch the service
- WantedBy
 - Run this service at which target

```
[Unit]
Description=Some simple daemon

[Service]
Type=forking
ExecStart=/usr/sbin/my-simple-daemon -d
PIDFile=/var/run/my-daemon.pid

[Install]
WantedBy=multi-user.target
```

Unit files

❑ Example 2: (apache2.service)

- After
 - Dependency. Start service after dependency is fulfilled
- ExecStop / ExecReload
 - Custom command to stop / reload the service

```
[Unit]
Description=The Apache HTTP Server
After=network.target remote-fs.target nss-lookup.target

[Service]
Type=forking
Environment=APACHE_STARTED_BY_SYSTEMD=true
ExecStart=/usr/sbin/apachectl start
ExecStop=/usr/sbin/apachectl stop
ExecReload=/usr/sbin/apachectl graceful
PrivateTmp=true
Restart=on-abort

[Install]
WantedBy=multi-user.target
```

Unit files

- ❑ When enable a service, it will create links from “/lib/systemd/system/*.service” to “/etc/systemd/system/XXX.target.wants/*”
 - /etc/systemd/system/multi-user.target.wants/apache2.service
-> /lib/systemd/system/apache2.service

```
13:18 lctseng@lctseng-sa-ubuntu(10.0.2.15) [/etc/systemd/system/multi-user.target.wants]
[XD] % ll
total 8
drwxr-xr-x  2 root root 4096 Sep 30 12:21 .
drwxr-xr-x 15 root root 4096 Sep 28 23:25 ..
