# Introduction

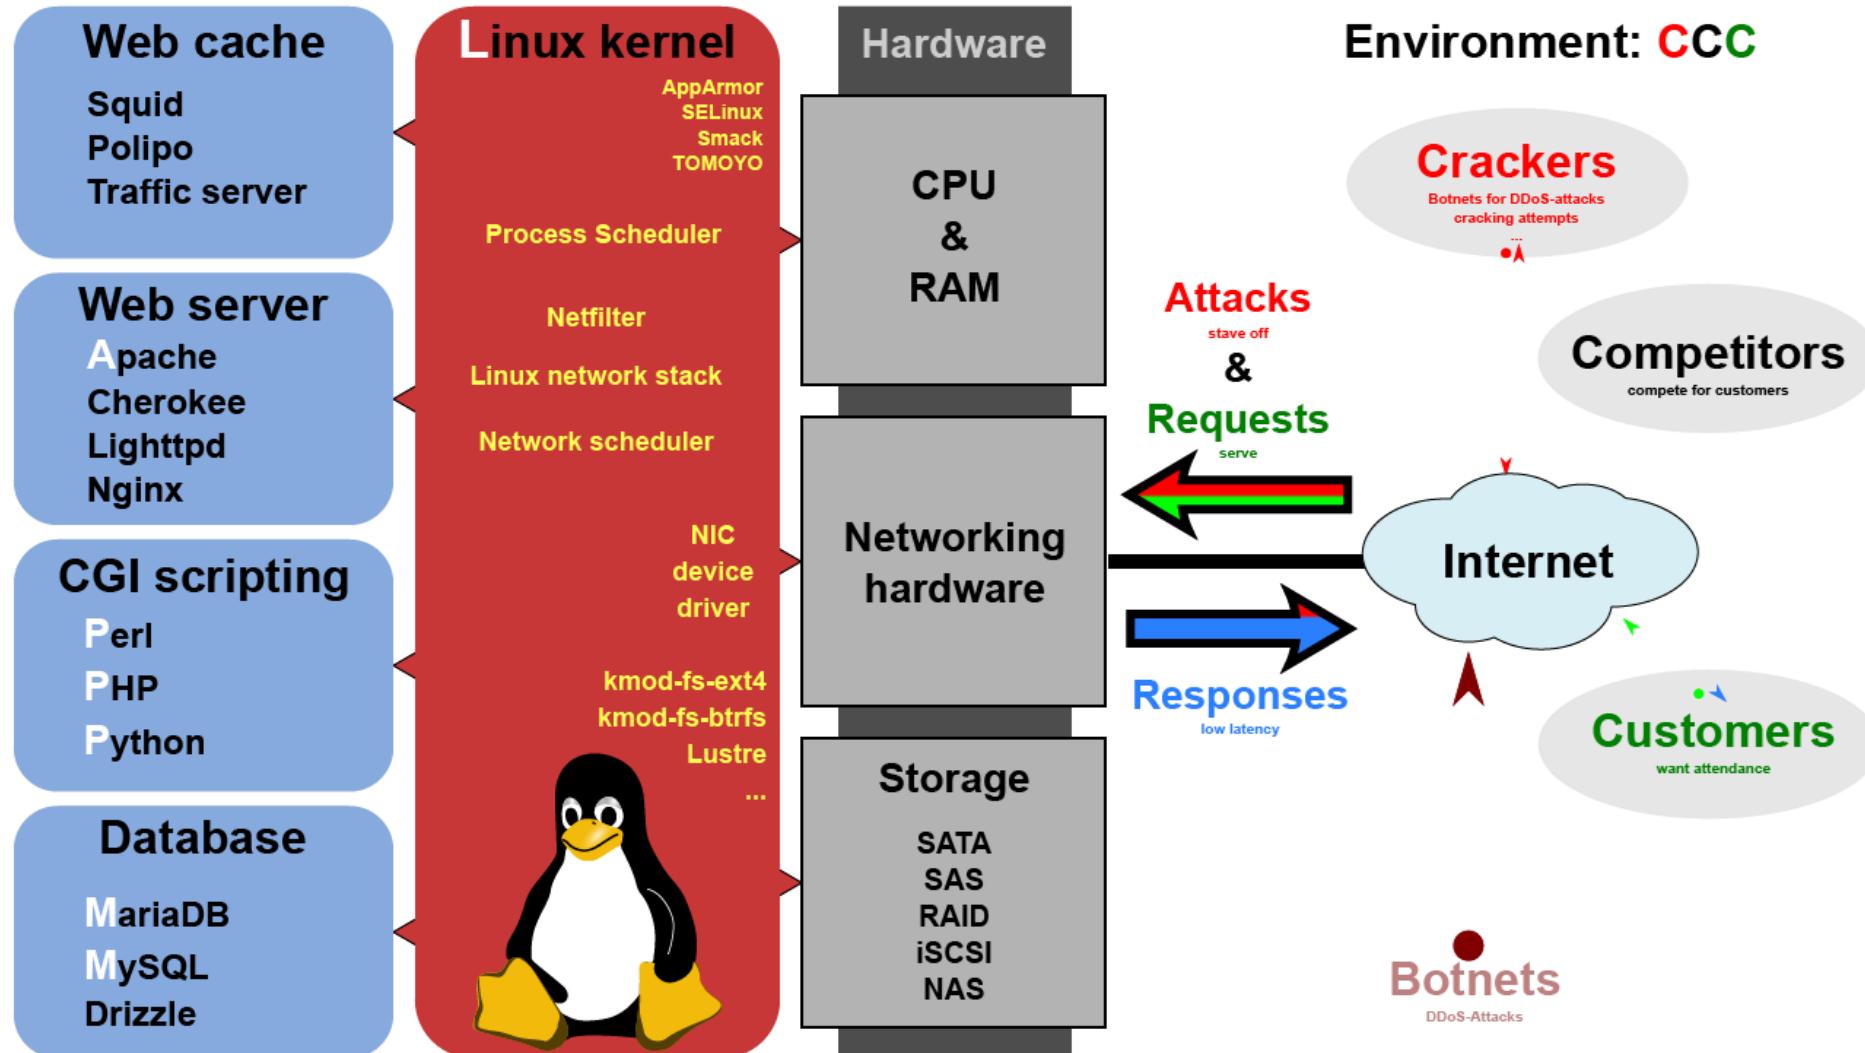

- Web service
  - Apache
  - GWS, Nginx, IIS
- SQL service
  - MySQL, MariaDB
  - MS SQL, Oracle DB, PostgreSQL
- NoSQL service
  - MongoDB
- Web backend language
  - Golang, Python, Node.js, PHP

# Outline

- Introduction
  - Apache
  - MySQL
  - PHP
- Installation and Administration
  - MySQL
  - Apache
  - PHP
- Appendix
  - phpMyAdmin
  - lighttpd
  - FastCGI

# Overview

by Shmuel Csaba Otto Traian; CC BY-SA 4.0; created 2013-09-10, last updated 2014-03-28

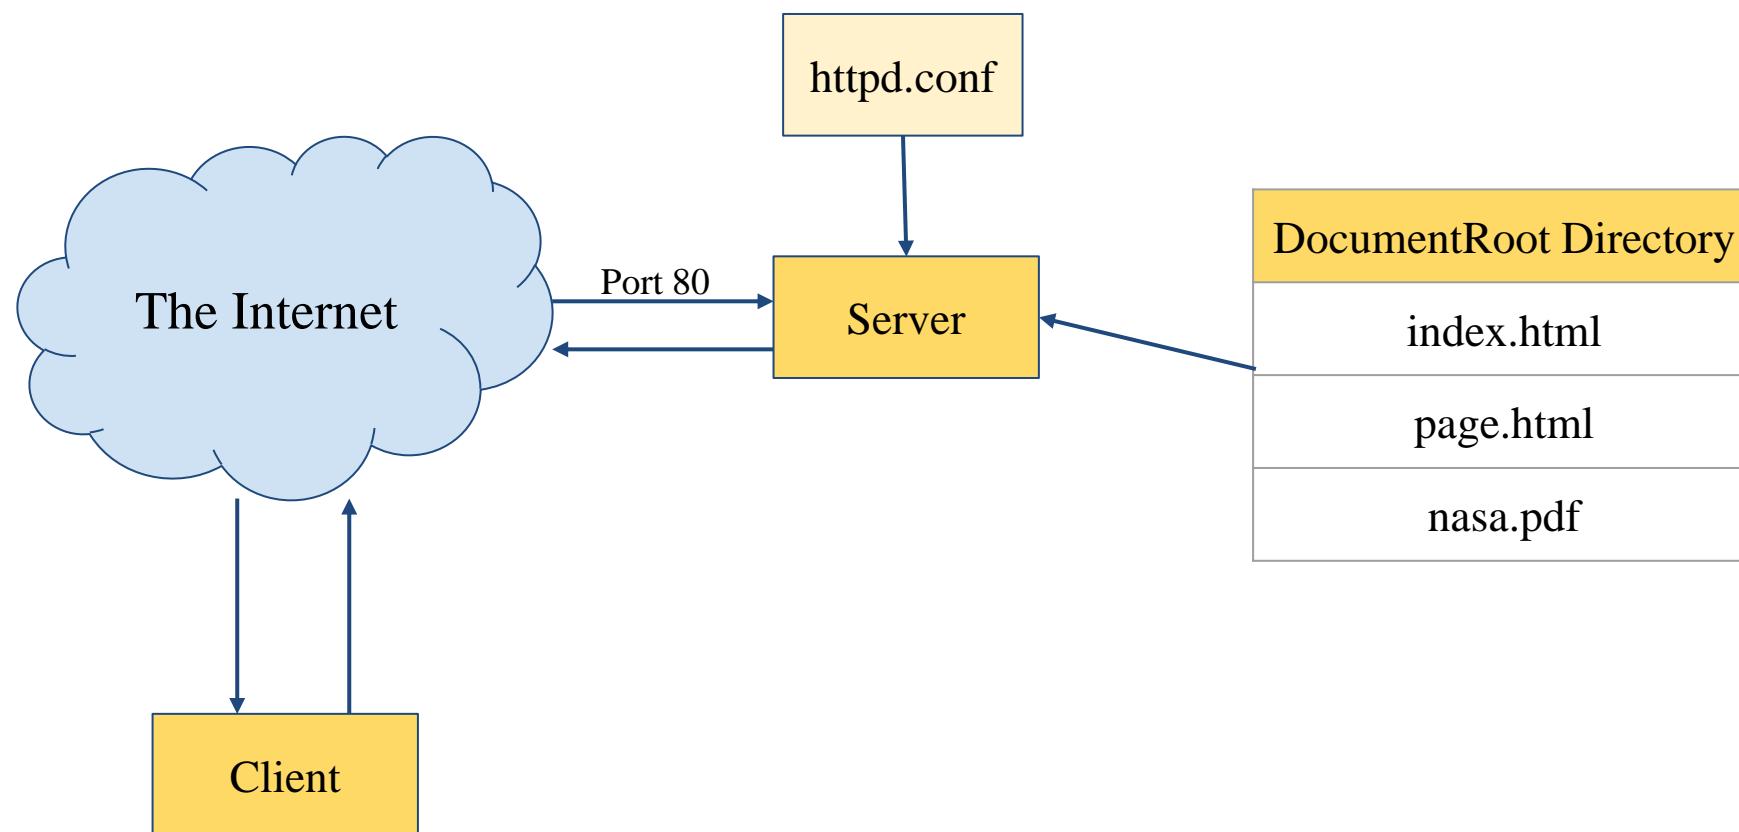

<https://commons.wikimedia.org/w/index.php?curid=28224098>

# Apache

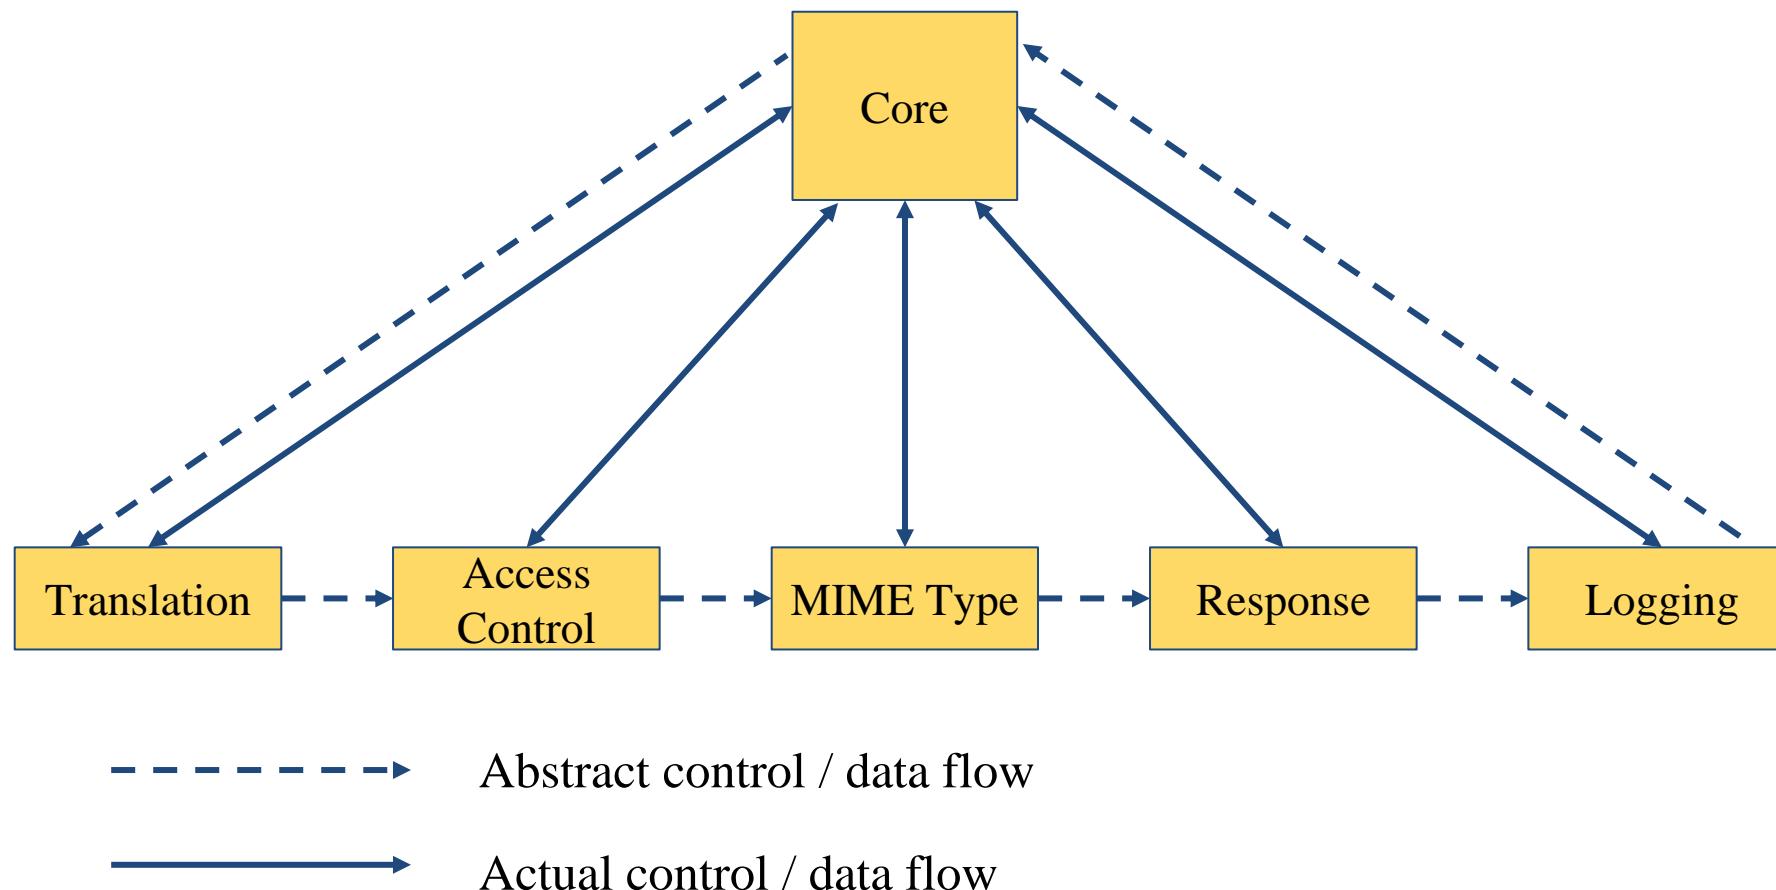

- Apache Software Foundation: <http://www.apache.org/>
- Apache HTTP Server Project: <http://httpd.apache.org/>
- Web httpd server that supports
  - HTTP/2
  - Modular design
  - Can be customized by writing modules using Apache module API
  - Freely available across many platforms
- Two main parts
  - Core: implements basic functions and provide the interface for Apache modules
  - Modules: extends or overrides the function of Core
    - Example: Access control, logging, CGI, proxy, cache control, PHP...

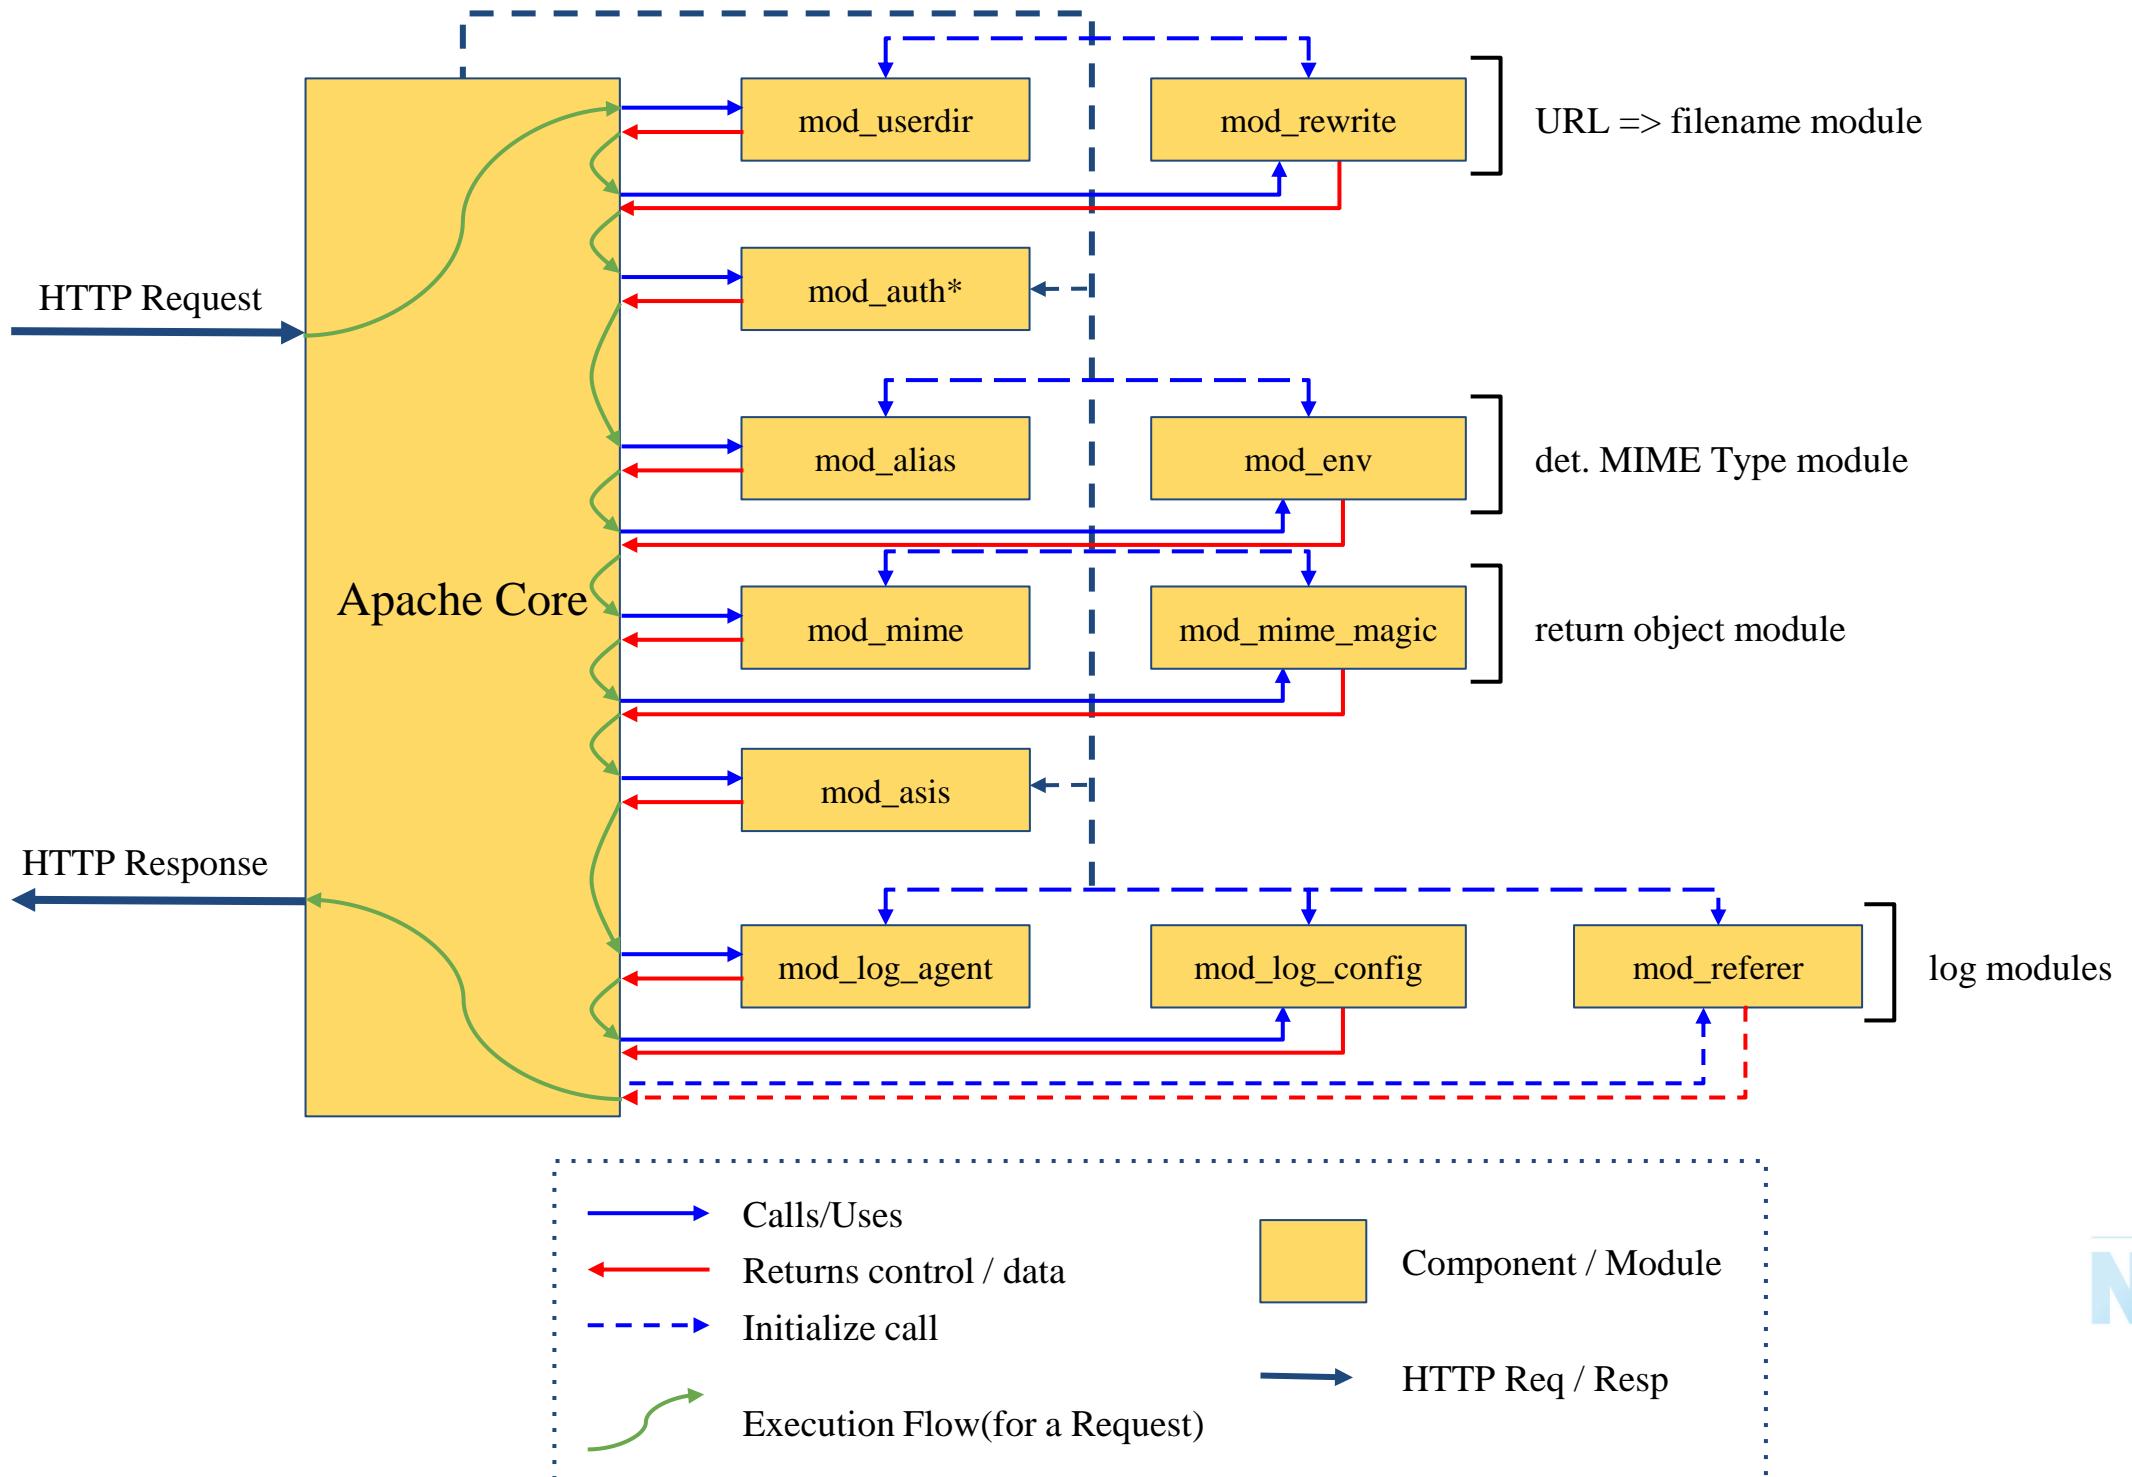

# How Apache Works – request and response

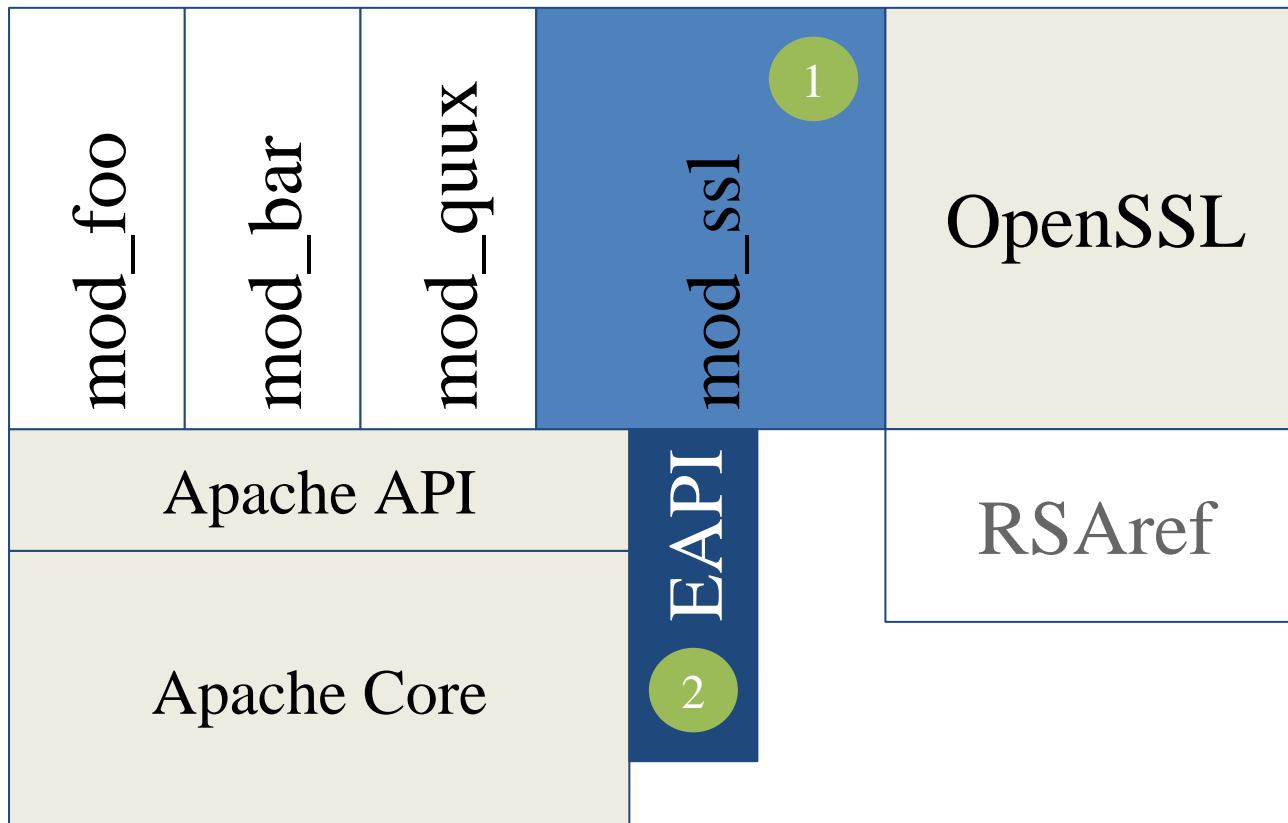

# How Apache Works – each request-response

- Apache breaks client request into several steps which are implemented as modules

# Apache with mod\_ssl

# MySQL (1)

- SQL (Structured Query Language)
  - The most popular computer language used to create, modify, retrieve and manipulate data from **relational database** management systems.
  - Introduction to SQL: <http://www.1keydata.com/tw/sql/sql.html>
- A **multithreaded, multi-user, SQL** Database Management System.
- Owned and sponsored by a Swedish company MySQL AB, acquired by Sun Microsystems 2008. Oracle acquired Sun in 2009.
  - Forked version: [MariaDB](#), [Percona Server](#)
- Official Site: <http://www.mysql.com>
- Documentation: <http://dev.mysql.com/doc>

# MySQL (2)

- Features:
  - Writing in C/C++, tested by many compilers, **portable to many platforms.**
    - AIX, FreeBSD, HP-UX, Linux, Mac OS, Solaris, Windows, ...etc.
  - Providing APIs for C/C++, Java, Perl, PHP, Python, Ruby, Tcl, ...etc.
  - **Multi-threaded** kernel, supporting systems with multiple CPUs.
  - Optimized algorithm for **SQL** Query.
  - Multi-Language (coding) Supports.
  - Lots of connecting method: TCP/IP, ODBC, JDBC, Unix domain socket.
  - **Free Software** (GNU General Public License version 2)
  - Popular for web applications

# PHP

- PHP: Hypertext Preprocessor
  - A widely-used Open Source general-purpose scripting language.
  - Originally designed to create dynamic web pages, PHP's principal focus is server-side scripting.
  - PHP scripts can be embedded into HTML.
  - The LAMP architecture has become popular in the Web industry as a way of deploying inexpensive, reliable, scalable, secure web applications.
- Official Site: <http://php.net/>

# Installation and Administration

MySQL, Apache, PHP, phpMyAdmin

陽明交大資工系資訊中心

Information Technology Center of Department of Computer Science, NYCU

# Installing MySQL (1)

- Steps

- \$ cd /usr/ports/databases/mysql57-server/
- \$ make OPTIONS install clean

You may use the following build options:

```
WITH_CHARSET=charset Define the primary built-in charset (latin1).
WITH_XCHARSET=list Define other built-in charsets (may be 'all').
WITH_COLLATION=collate Define default collation (latin1_swedish_ci).
WITH_OPENSSL=yes      Enable secure connections
                      (define WITHOUT_YASSL for backward compatibility).
WITH_LINUXTHREADS=yes Use the linuxthreads pthread library.
WITH_PROC_SCOPE_PTH=yes Use process scope threads
                         (try it if you use libpthread).
WITH_FAST_MUTEXES=yes Replace mutexes with spinlocks.
BUILD_OPTIMIZED=yes   Enable compiler optimizations
                         (use it if you need speed).
BUILD_STATIC=yes      Build a static version of mysqld.
                         (use it if you need even more speed).
WITH_NDB=yes          Enable support for NDB Cluster.
```

# Installing MySQL (2)

- OPTIONS:
  - WITH\_CHARSET=utf8
  - WITH\_XCHARSET=ascii,big5,... (all)
- Installed...

```
====> SECURITY REPORT:
```

```
This port has installed the following files which may act as network servers and may therefore pose a remote security risk to the system.  
/usr/local/libexec/mysqld
```

```
This port has installed the following startup scripts which may cause these network services to be started at boot time.  
/usr/local/etc/rc.d/mysql-server
```

# Installing MySQL (3)

- Startup script...

```
#  
# Add the following line to /etc/rc.conf to enable mysql:  
# mysql_enable (bool): Set to "NO" by default.  
#                                         Set it to "YES" to enable MySQL.  
# mysql_limits (bool): Set to "NO" by default.  
#                                         Set it to yes to run `limits -e -U mysql`  
#                                         just before mysql starts.  
# mysql_dbdir (str): Default to "/var/db/mysql"  
#                                         Base database directory.  
# mysql_args (str): Custom additional arguments to be passed  
#                                         to mysqld_safe (default empty).  
#
```

# Managing MySQL (1)

- Configuration file
  - Copy config file
    - \$ cd /usr/local/share/mysql
    - \$ cp my-huge.cnf /usr/local/etc/my.cnf
  - Edit /usr/local/etc/my.cnf
- Start mysql daemon
  - Using startup script
    - \$ /usr/local/etc/rc.d/mysql-server start

# Managing MySQL (2)

- Test
  - \$ mysql -u root -p
    - The initial password for root is empty

```
$ mysql -u root -p
Enter password:
Welcome to the MySQL monitor.  Commands end with ; or \g.
Your MySQL connection id is 1
Server version: 5.1.41-log FreeBSD port: mysql-server-5.1.41

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

mysql> show databases;
+-----+
| Database           |
+-----+
| information_schema |
| mysql              |
| test               |
+-----+
3 rows in set (0.06 sec)
```

# Managing MySQL (3)

- Securing initial accounts
  - Two initial accounts
    - root
    - anonymous

```
mysql> SELECT Host, User From mysql.user;
+-----+-----+
| Host | User |
+-----+-----+
| 127.0.0.1 | root |
| nasa.cs.nctu.edu.tw | |
| nasa.cs.nctu.edu.tw | root |
| localhost | |
| localhost | root |
+-----+-----+
```

```
mysql> UPDATE mysql.user SET Password = PASSWORD('test123') WHERE User = 'root';
Query OK, 3 rows affected (0.08 sec)
Rows matched: 3  Changed: 3  Warnings: 0

mysql> FLUSH PRIVILEGES;          # Reload the grant tables
Query OK, 0 rows affected (0.00 sec)

mysql> SET PASSWORD FOR 'root'@'localhost' = PASSWORD('ttt123');
Query OK, 0 rows affected (0.02 sec)
```

# Installing Apache (1)

- Steps
  - \$ cd /usr/ports/www/apache24/
  - \$ make install clean
- Options
  - A lot of options for modules
  - WITH\_SSL (default)
  - WITH\_MPM=worker
  - WITH\_THREADS=yes
  - WITH\_SUEXEC=yes

# Installing Apache (2)

- Installed...

```
To run apache www server from startup, add apache22_enable="YES"  
in your /etc/rc.conf. Extra options can be found in startup script.
```

```
Your hostname must be resolvable using at least 1 mechanism in  
/etc/nsswitch typically DNS or /etc/hosts or apache might  
have issues starting depending on the modules you are using.
```

```
====> SECURITY REPORT:
```

```
This port has installed the following binaries which execute with  
increased privileges.
```

```
/usr/local/sbin/suexec
```

- Startup script

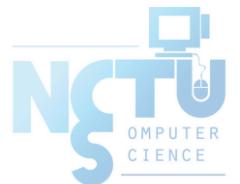

- /usr/local/etc/rc.d/apache24
- apache24\_http\_accept\_enable

# Apache configuration – Configuration files

- Location
  - The default location of apache (in ports) is /usr/local/etc/apache24
  - Major configuration file: httpd.conf
    - Other configuration files could be included. (setting in httpd.conf)
    - extra/httpd-\*.conf, Includes/\*.conf
- Two types
  - Global settings
    - Server configurations
    - Options of modules
  - Directory Configuration
    - Local setting for certain directory

# Apache configuration – Global Settings (httpd.conf)

- Server configuration
  - Listen 80
  - ServerAdmin tsaimh@cs.nctu.edu.tw
  - ServerName nasa.cs.nctu.edu.tw
  - DocumentRoot "/home/wwwadm/data"
    - Remember create DocumentRoot directory if you modify it
- Options of modules
- Include supplemental configuration files
  - Include etc/apache22/extrahttpd-\* .conf
  - Include etc/apache22/Includes/\* .conf

# Apache configuration – Directory Configuration (1)

- Configuration parameters
  - Options
    - All
    - ExecCGI
    - FollowSymLinks
    - Indexs
    - MultiViews
    - SymLinksIfOwnerMatch
  - <http://httpd.apache.org/docs/2.4/mod/core.html#options>

```
<Directory "/home/wwwadm/data">
    Options Indexes FollowSymLinks Multiviews
    AllowOverride None
    Order allow,deny
    Allow from all
</Directory>
```

# Apache configuration – Directory Configuration (2)

- Configuration parameters
  - AllowOverride
    - All (Read .htaccess)
    - None (ignoring .htaccess)
  - Order
    - Solve collision of deny and allow rules
  - Deny/Allow
    - IP/DN (control access to this directory)

```
<Directory "/home/wwwadm/data">
    Options Indexes FollowSymLinks Multiviews
    AllowOverride None
    Order allow,deny
    Allow from all
</Directory>
```

# Apache configuration – Options of Modules

- `dir_module`

```
<IfModule dir_module>
    DirectoryIndex index.html
</IfModule>
```

- `alias_module` ([http://httpd.apache.org/docs/2.2/mod/mod\\_alias.html](http://httpd.apache.org/docs/2.2/mod/mod_alias.html))

```
<IfModule alias_module>
    Redirect /foo http://www.example.com/bar
    Alias /webpath /full/filesystem/path
    ScriptAlias /cgi-bin/ "/usr/local/www/apache22/cgi-bin/"
</IfModule>
```

- `mime_module`

```
DefaultType text/plain
<IfModule mime_module>
    TypesConfig etc/apache22/mime.types
    AddType application/x-compress .Z
    AddHandler cgi-script .cgi
</IfModule>
```

# Supplemental configuration – httpd-mpm.conf (Multi-Processing Module)

- Server-pool management (MPM specific)
  - Include etc/apache22/extrahttpd-mpm.conf
- WITH\_MPM
  - prefork: non-threaded, pre-forking
  - worker: hybrid multi-process multi-threaded

```
<IfModule mpm_worker_module>
    StartServers          2
    MaxClients           150
    MinSpareThreads      25
    MaxSpareThreads      75
    ThreadsPerChild       25
    MaxRequestsPerChild   0
</IfModule>
```

# Supplemental configuration – httpd-userdir.conf

- User home directories
  - Include etc/apache22/extrahtdp-userdir.conf

```
UserDir public_html
UserDir disabled root toor daemon operator bin tty kmem games news man sshd bind proxy
_pflogd _dhcp uucp pop www nobody mailnull smmsp

<Directory "/home/*public_html">
    AllowOverride FileInfo AuthConfig Limit Indexes
    Options MultiViews Indexes SymLinksIfOwnerMatch IncludesNoExec
    <Limit GET POST OPTIONS>
        Order allow,deny
        Allow from all
    </Limit>
    <LimitExcept GET POST OPTIONS>
        Order deny,allow
        Deny from all
    </LimitExcept>
</Directory>
```

- Methods: <http://www.w3.org/Protocols/rfc2616/rfc2616-sec9.html>

# Supplemental configuration – httpd-vhosts.conf

- Virtual hosts
  - Include  
etc/apache24/extrahttpd-vhosts.conf
  - Name-based
    - NameVirtualHost
    - <VirtualHost>
  - IP-based
    - <VirtualHost>
  - ServerName
  - DocumentRoot
  - <http://httpd.apache.org/docs/2.2/vhosts>

```
Listen 80
Listen 8080

NameVirtualHost 172.20.30.40:80
NameVirtualHost 172.20.30.40:8080
<VirtualHost 172.20.30.40:80>
    ServerName www.example.com
    DocumentRoot /www/domain-80
</VirtualHost>
<VirtualHost 172.20.30.40:8080>
    ServerName www.example.com
    DocumentRoot /www/domain-8080
</VirtualHost>

    ServerName www.example.org
    DocumentRoot /www/otherdomain-8080
</VirtualHost>
```

# Supplemental configuration – More...

- Multi-language error messages
  - `httpd-multilang-errordoc.conf`
- Fancy directory listings
  - `httpd-autoindex.conf`
- Language settings
  - `httpd-languages.conf`
- Real-time info on requests and configuration
  - `httpd-info.conf`
- Local access to the Apache HTTP Server Manual
  - `httpd-manual.conf`
- Various default settings
  - `httpd-default.conf`

# Other configuration for Apache – log

- Rotate your log using newsyslog
- In httpd config
  - ErrorLog "/var/log/httpd-error.log"
  - TransferLog "/var/log/httpd-access.log"

```
/var/log/httpd-access.log      640  5  *  @T00    z  /var/run/httpd.pid  
/var/log/httpd-error.log      640  5  *  @T00    z  /var/run/httpd.pid
```

- In startup script
  - `_pidprefix="/var/run/httpd"`
  - `pidfile="$[_pidprefix].pid"`

# .htaccess (1)

- .htaccess
  - Allow admin or users to control access to certain directory
- Usage
  - Modify httpd.conf
  - Create .htaccess file
  - Generate password database
  - Test

# .htaccess (2)

- Example
  - Modify httpd.conf
  - Create .htaccess file
  - Generate password file

```
<Directory "/home/wwwadm/data/test1">
    Options None
    AllowOverride All
    Order allow,deny
    Allow from all
</Directory>
```

```
$ cat .htaccess
AuthName "SA-test1"
AuthType "Basic"
AuthUserFile "/home/wwwadm/data/test1/.htpasswd"
Require valid-user
Options Indexes
```

```
$ htpasswd -c ./htpasswd SA-user1
New password:
Re-type new password:
Adding password for user SA-user1
```

# .htaccess (3)

- You can use these tools to generate .htaccess
  - <http://www.linuxkungfu.org/tools/htaccesser/index.php>
  - <http://www.htaccesseditor.com/>

# Installing PHP7 (1)

- Steps

- \$ pkg install php74 php74-mysqli mod\_php74 php74-zlib \  
php74-mbstring php74-gd php74-json php74-curl
- \$ vim /usr/local/etc/apache24/Includes/php.conf

```
<IfModule dir_module>
    DirectoryIndex index.php index.html
    <FilesMatch "\.php$">
        SetHandler application/x-httpd-php
    </FilesMatch>
    <FilesMatch "\.phps$">
        SetHandler application/x-httpd-php-source
    </FilesMatch>
</IfModule>
```

# Test PHP7 in apache (2)

- Start apache
  - \$ /usr/local/etc/rc.d/apache24 start
  - \$ service apache24 restart
- Test PHP
  - \$ vim /usr/local/www/apache24/data/index.php

```
<?
    phpinfo();
?>
```

# phpinfo()

# Architecture

Cluster, Server Load Balancer

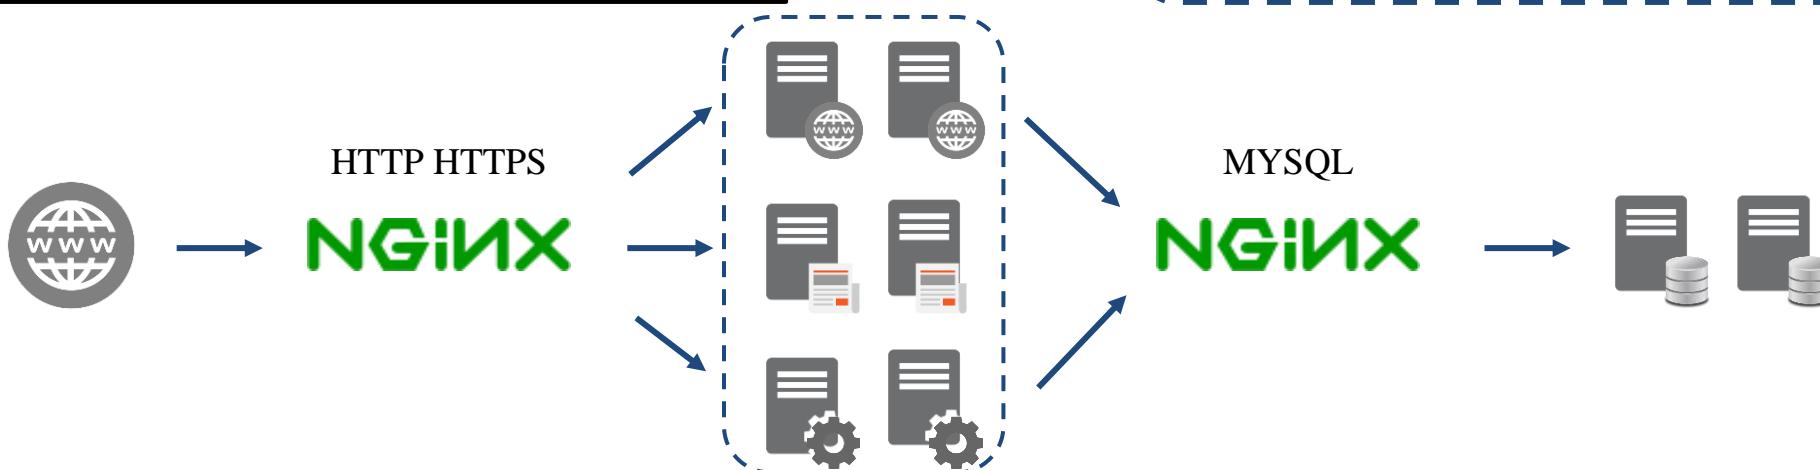

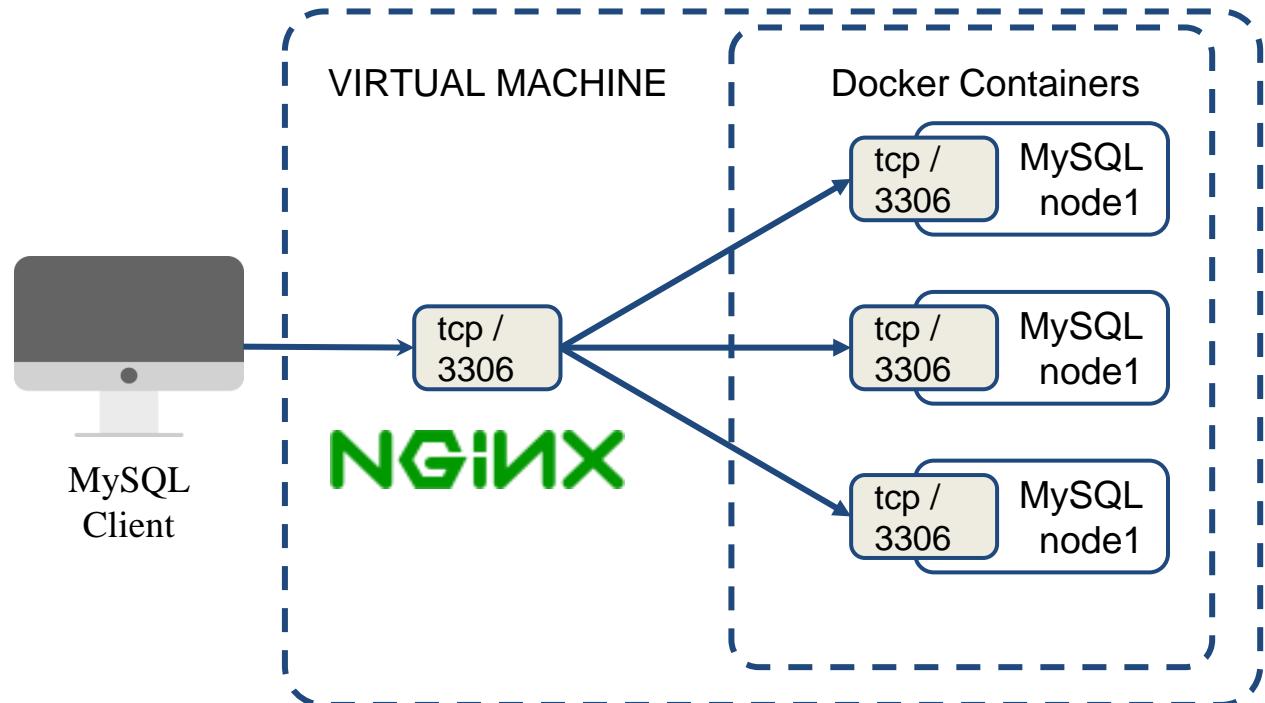

陽明交大資工系資訊中心

Information Technology Center of Department of Computer Science, NYCU

# Load balance

- Nginx proxy

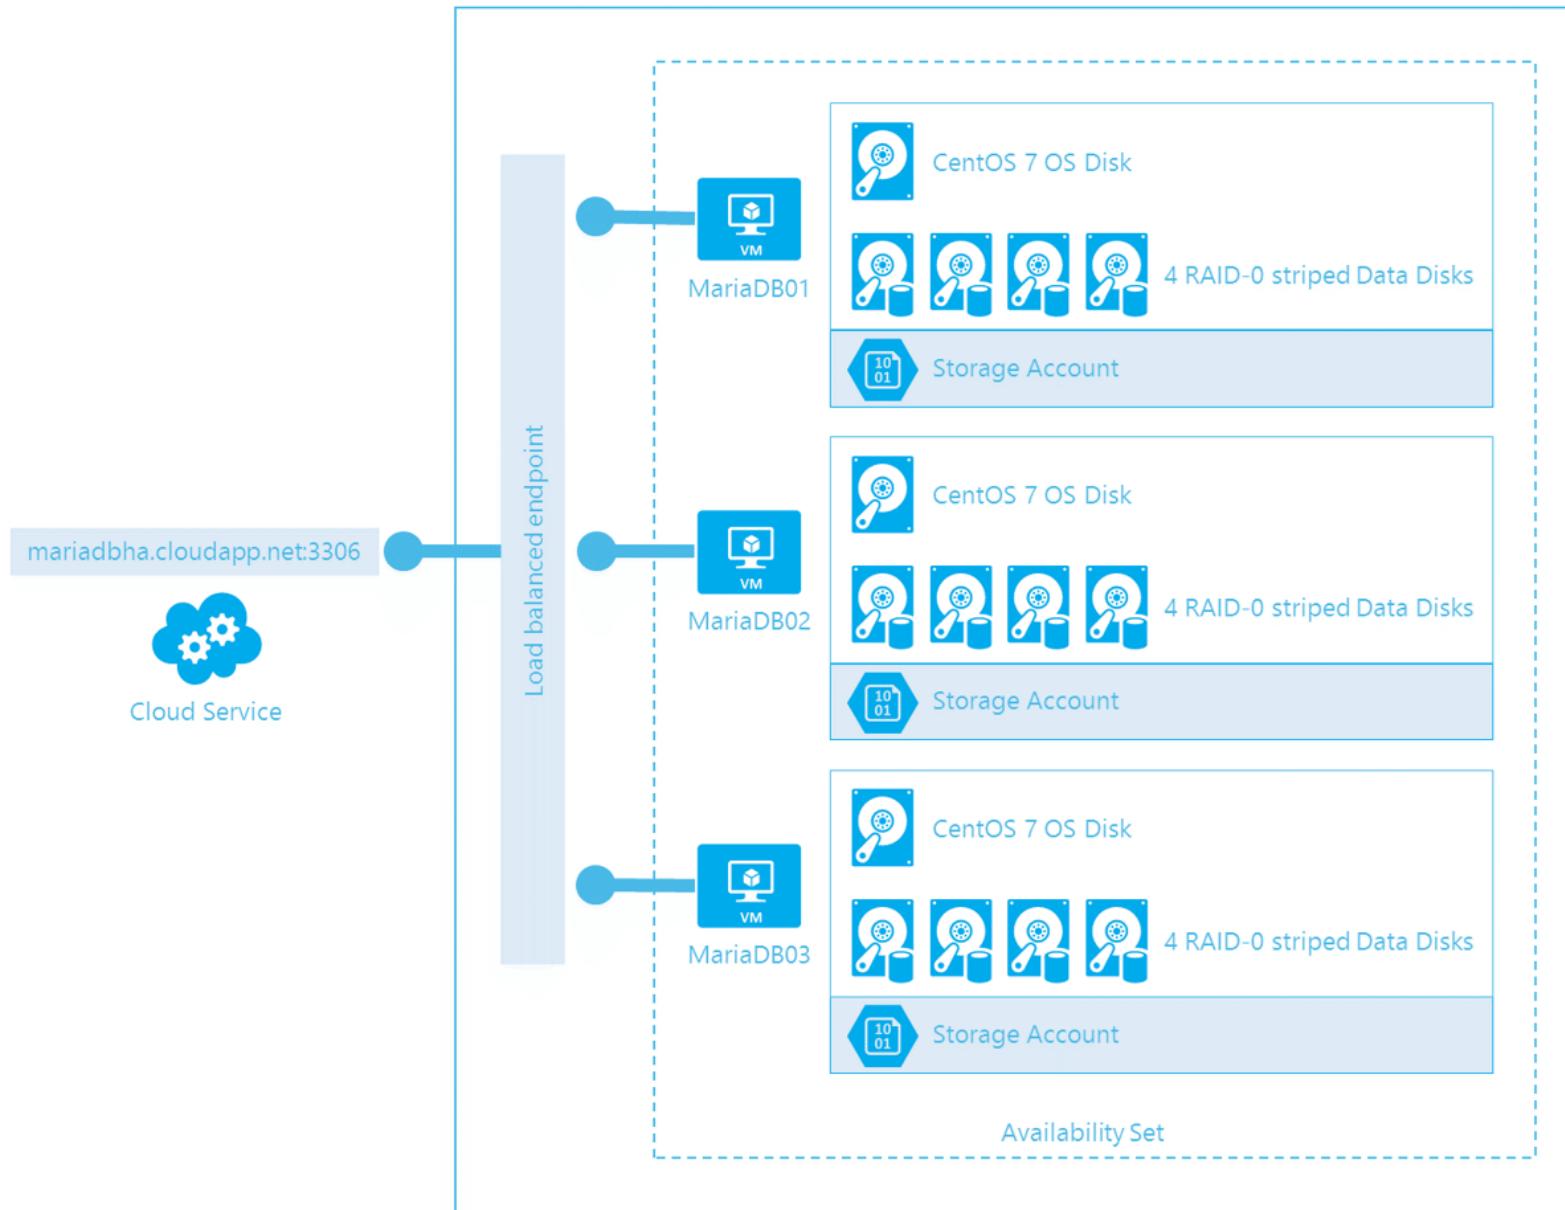

```
upstream backend {  
    server 172.16.1.1:3000;  
    server 172.16.1.2:3000;  
}  
  
server {  
    listen 80;  
    server_name www.example.com;  
    location / {  
        proxy_pass  
        http://backend;  
    }  
}
```

# Load balance

- Open Source
  - haproxy - <http://www.haproxy.org/>
  - envoy - <https://www.envoyproxy.io/>
- Commercial
  - F5
  - A10
  - AWS ELB
  - Google Cloud Load Balance

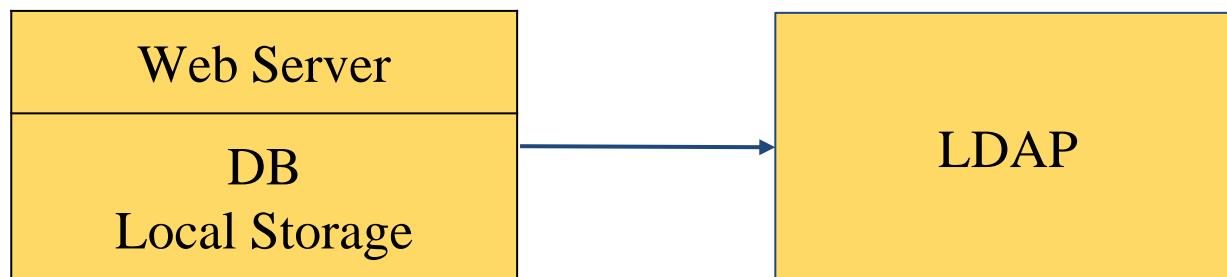

# MySQL cluster

<https://sabbour.me/running-a-mariadb-cluster-on-azure/>

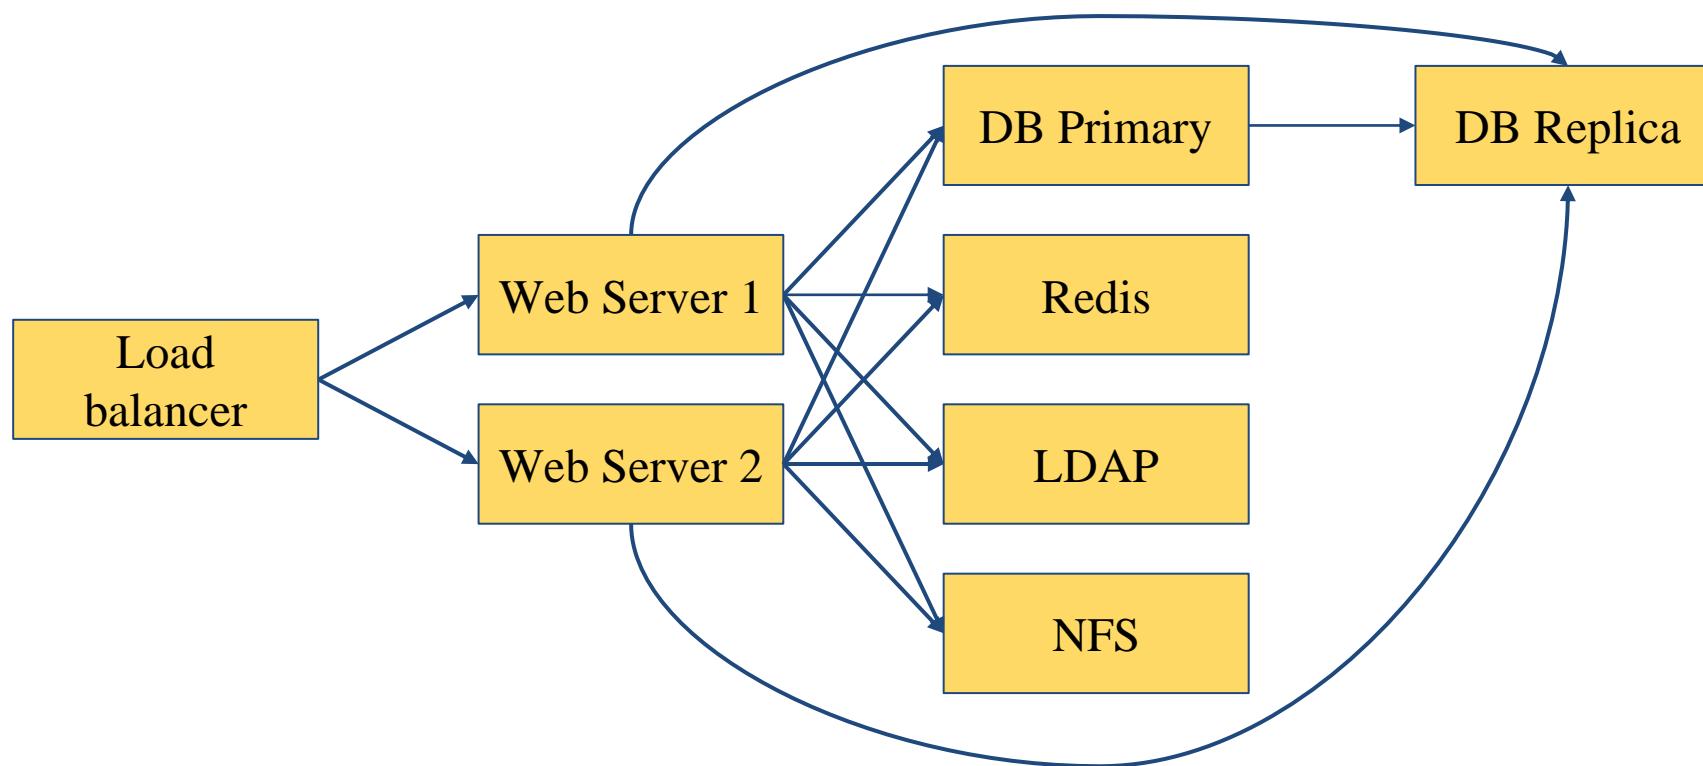

# Up to 150 users

- One machine running the application server.
  - Web server
  - database server
  - local storage
- Authentication via an existing LDAP or Active Directory server.

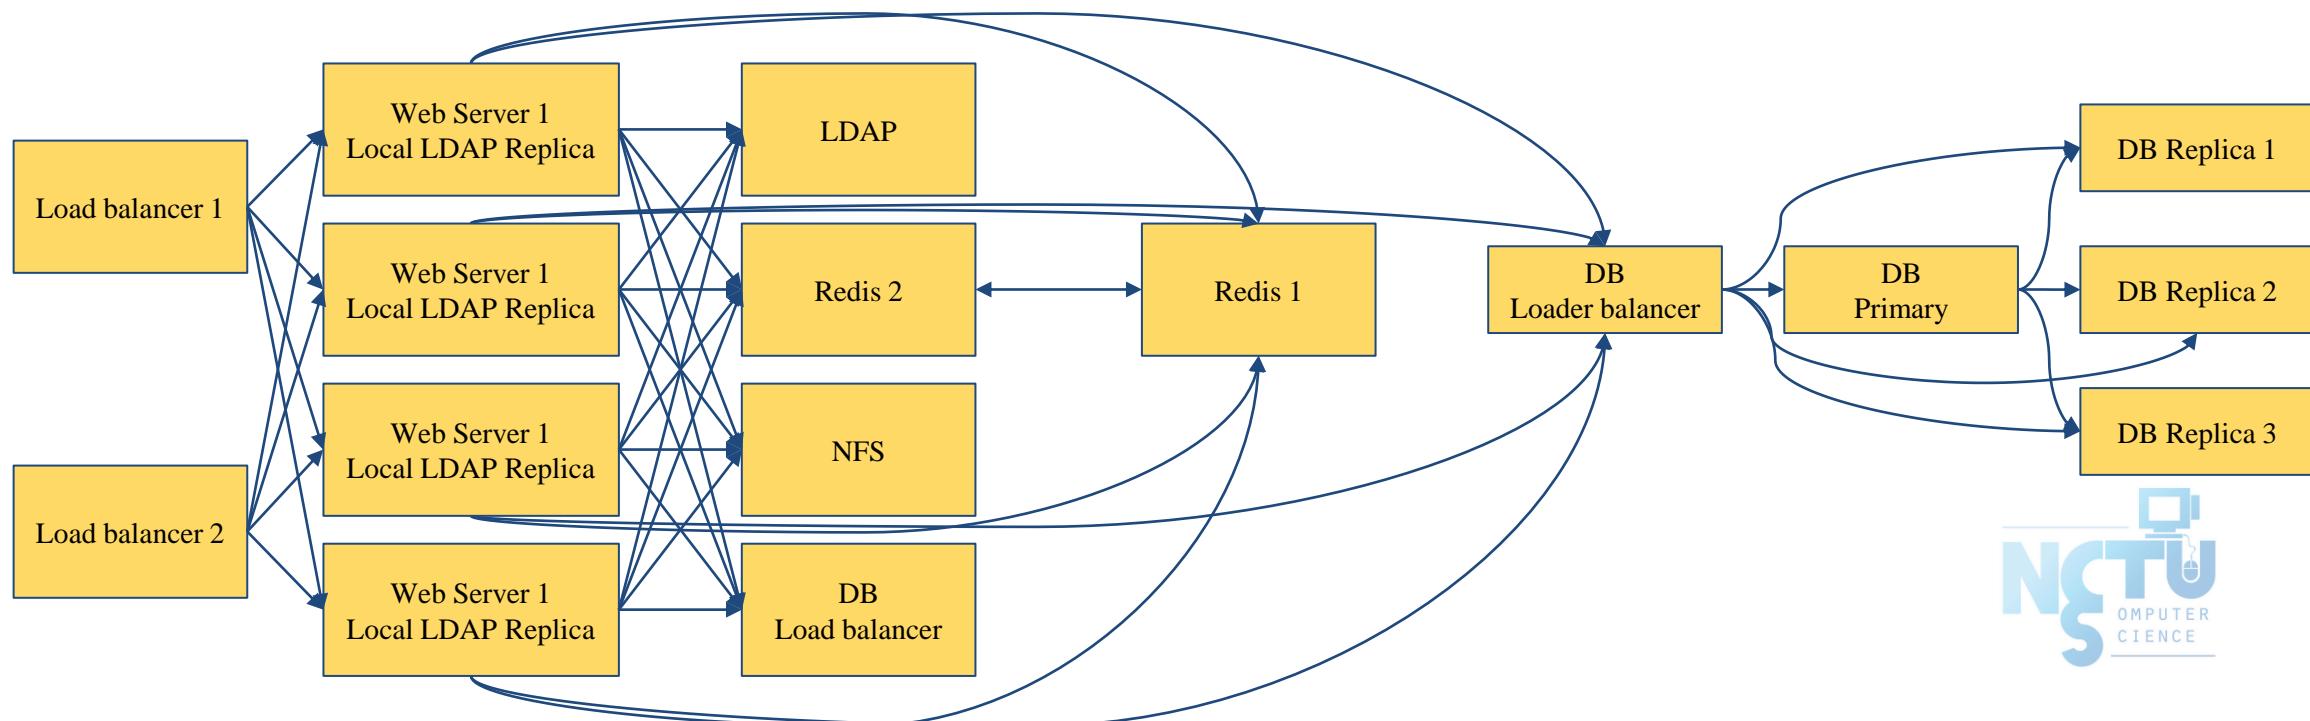

# 150 to 1,000 users

- High availability level
  - Every component is fully redundant and can fail without service interruption.
  - Backups without service interruption

# 5,000 to >100,000 users

- 4 to 20 application/Web servers.
- A cluster of two or more database servers
  - behind a load balancer to send all writes to the master and reads to the slaves.
- Storage is an NFS server, or an object store that is S3 compatible.

# Appendix

phpMyAdmin / lighttpd / FastCGI

陽明交大資工系資訊中心

Information Technology Center of Department of Computer Science, NYCU

# phpMyAdmin

- phpMyAdmin can manage a whole MySQL server as well as a single database over the World Wide Web.
- Official Site: <http://www.phpmyadmin.net/>
- Documentation: <http://www.phpmyadmin.net/documentation/>
- Features
  - Browser-based, Supporting PHP5.3+, MySQL 5.0+, Open Source
- There are four authentication modes offered:
  - http
  - cookie
  - signon
  - config (the less secure one, not recommended).

# Installing phpMyAdmin (1)

- databases/phpmyadmin
  - \$ make install clean
- Installed...

```
phpMyAdmin-4.7.4 has been installed into:  
/usr/local/www/phpMyAdmin  
  
Please edit config.inc.php to suit your needs.  
  
To make phpMyAdmin available through your web site, I suggest  
that you add something like the following to httpd.conf:  
  
Alias /phpmyadmin/ "/usr/local/www/phpMyAdmin/"  
  
<Directory "/usr/local/www/phpMyAdmin/">  
    Options none  
    AllowOverride Limit  
  
    Order Deny,Allow  
    Deny from all  
    Allow from 127.0.0.1 .example.com  
</Directory>
```

# Installing phpMyAdmin (2)

- config.inc.php
  - Override libraries/config.default.php
- config.sample.inc.php
  - \$cfg['blowfish\_secret']

# Administering MySQL – Using phpMyAdmin (3)

# Administering MySQL – Using phpMyAdmin (4)

The screenshot shows the phpMyAdmin interface for MySQL administration. The left sidebar lists databases: 新增, absolaser, comblaser, comblasert, demo, demoams, information\_schema, moviesystem, mysql, performance\_schema, phpmyadmin, technology, testkevin, and video. The main content area has three tabs: 一般設定 (General Settings), 外觀設定 (Appearance Settings), and 資料庫伺服器 (Database Server). The General Settings tab shows the connection encoding as utf8mb4\_unicode\_ci. The Appearance Settings tab shows the language as 中文 - Chinese traditional, theme as pmahomme, and font size as 82%. The Database Server tab displays the following information:

- 伺服器: Localhost via UNIX socket
- 伺服器類別: MariaDB
- 伺服器版本: 10.0.31-MariaDB-0ubuntu0.16.04.2 - Ubuntu 16.04
- 協定版本: 10
- 使用者: root@localhost
- 伺服器字元集: UTF-8 Unicode (utf8)

The Appearance Settings tab also includes a "更多設定" (More Settings) section.

**phpMyAdmin**

# Administering MySQL – Using phpMyAdmin (5)

- Create another user with limited privilege

The screenshot shows the 'Create User' interface in phpMyAdmin. The top navigation bar includes tabs for 資料庫, SQL, 狀態, 使用者帳號 (selected), 噴出, 噴入, 設定, 備援, 變數, 字元編碼, and 引擎.

**新增使用者帳號**

**登入資訊**

- 帳號: 使用文字方塊:
- 主機名稱: 任意主機  % (說明)
- 密碼: 使用文字方塊:
- 重新輸入:
- 認證外掛程式: 原生 MySQL 認證
- 產生密碼:

**使用者帳號的資料庫**

- 建立與使用者同名的資料庫並授予所有權限。
- 紿以 帳號\_ 開頭的資料庫 (username\%) 授予所有權限。

**全域權限**  **全選**

注意: MySQL 權限名稱會以英文表示。

# PopSQL & SQLpro (1)

The screenshot shows the PopSQL interface. At the top, there are three colored window control buttons (red, yellow, green). To the right, it says "dellstore" with a dropdown arrow, "Feedback" with a magnifying glass icon, and three small square icons for sharing. Below this is a toolbar with a green "Run" button and a blue "Share" button.

The main area has a title "Weekly orders" and contains the following SQL code:

```
1 select
2     date_trunc('week', orderdate) as week,
3     count(1)
4 from orders
5 where orderdate between '2004-01-01' and '2004-02-28'
6 group by 1
7 order by 1
8 limit 5;
```

To the right of the code, there are two execution results. The top result is a "Success" message with "5 rows" and a chart titled "Success". The chart shows a line graph with data points at Dec 29, 2003, Jan 5, 2004, Jan 12, 2004, Jan 19, 2004, and Jan 26, 2004. The values range from approximately 150 to 250. The bottom result is another "Success" message with "5 rows" and a table titled "week" and "count".

week	count
2003-12-29 00:00:00-08	125
2004-01-05 00:00:00-08	238
2004-01-12 00:00:00-08	225
2004-01-19 00:00:00-08	210
2004-01-26 00:00:00-08	241

# PopSQL & SQLpro (2)

The screenshot shows the SQLPro for Postgres application interface. On the left is a tree view of database objects for the 'dvdrental' schema. In the center, a query editor window titled 'SQLPro for Postgres — Untitled 5.sql' displays the following code:

```
1 SELECT * FROM nicer_but_slower_film_list LIMIT 100;
2 select * from city
```

The word 'city' is highlighted in blue, indicating it is being selected from a dropdown menu. Below the code, a results grid shows the first 20 rows of the 'film' table:

At the bottom of the results grid, the message 'Finished with 100 records. 0.217 seconds.' is displayed.

# Installing lighttpd

- www/lighttpd
  - Official: <http://www.lighttpd.net/>
- Configuration files
  - /usr/local/etc/lighttpd/{lighttpd,modules}.conf
  - /usr/local/etc/lighttpd/{vhosts,conf}.d/
- Startup script
  - /usr/local/etc/rc.d/lighttpd
- Documentation:
  - /usr/ports/www/lighttpd/work/lighttpd-1.4.28/doc/\*.txt
  - alias, cgi, dirlisting, fastcgi, ssl, userdir
  - Virtual hosts: evhost, mysqlvhost, simple-vhost

# FastCGI

- FastCGI is actually CGI with only a few extensions.
  - FastCGI is language-independent.
  - FastCGI run applications in processes isolated from the core Web server, which provides greater security than APIs.
  - FastCGI developers are committed to propagating FastCGI as an open standard. (C/C++, Java, Perl, Tcl)
  - FastCGI is not tied to the internal architecture of any Web server and is therefore stable even when server technology changes.
- Benefits:
  - Distributed computing
  - Multiple and extensible roles
- Official site: <http://www.fastcgi.com/drupal/>
